

Paleoceanography and Paleoclimatology

Supporting Information for

Global warming and equatorial Atlantic paleoceanographic changes during early Eocene carbon cycle perturbation V

*Figures S1 to S2
Supplementary references*

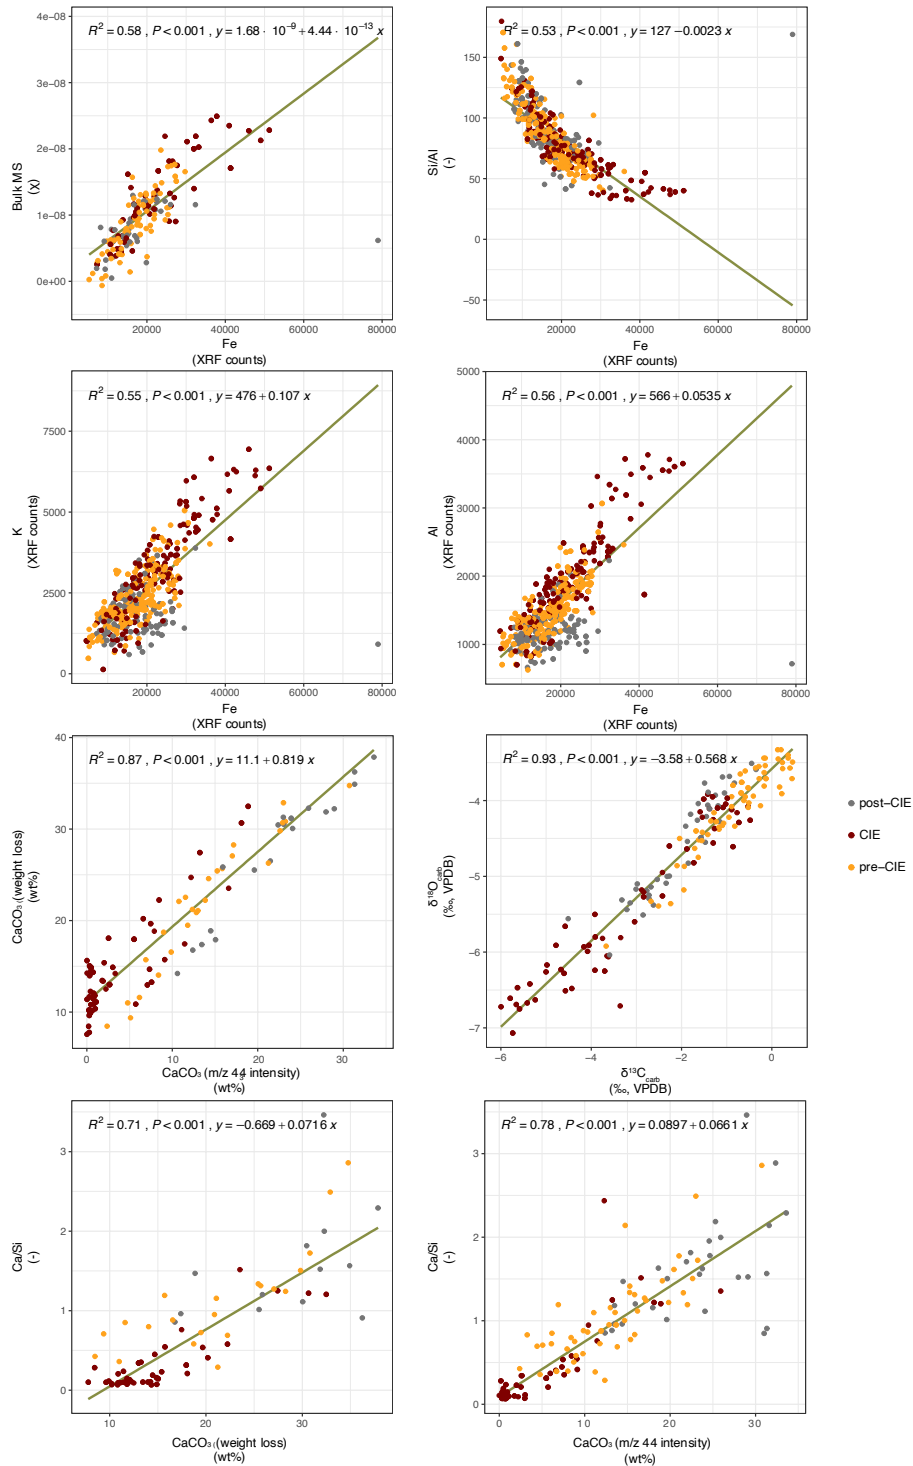

Figure S1. Scatterplots of various datasets generated in this study. Different core intervals, before, during and after the CIE (757.25–756.36 mbsf) are marked by yellow, red and grey, respectively. P -values, R^2 and formulae of linear regression model in green.

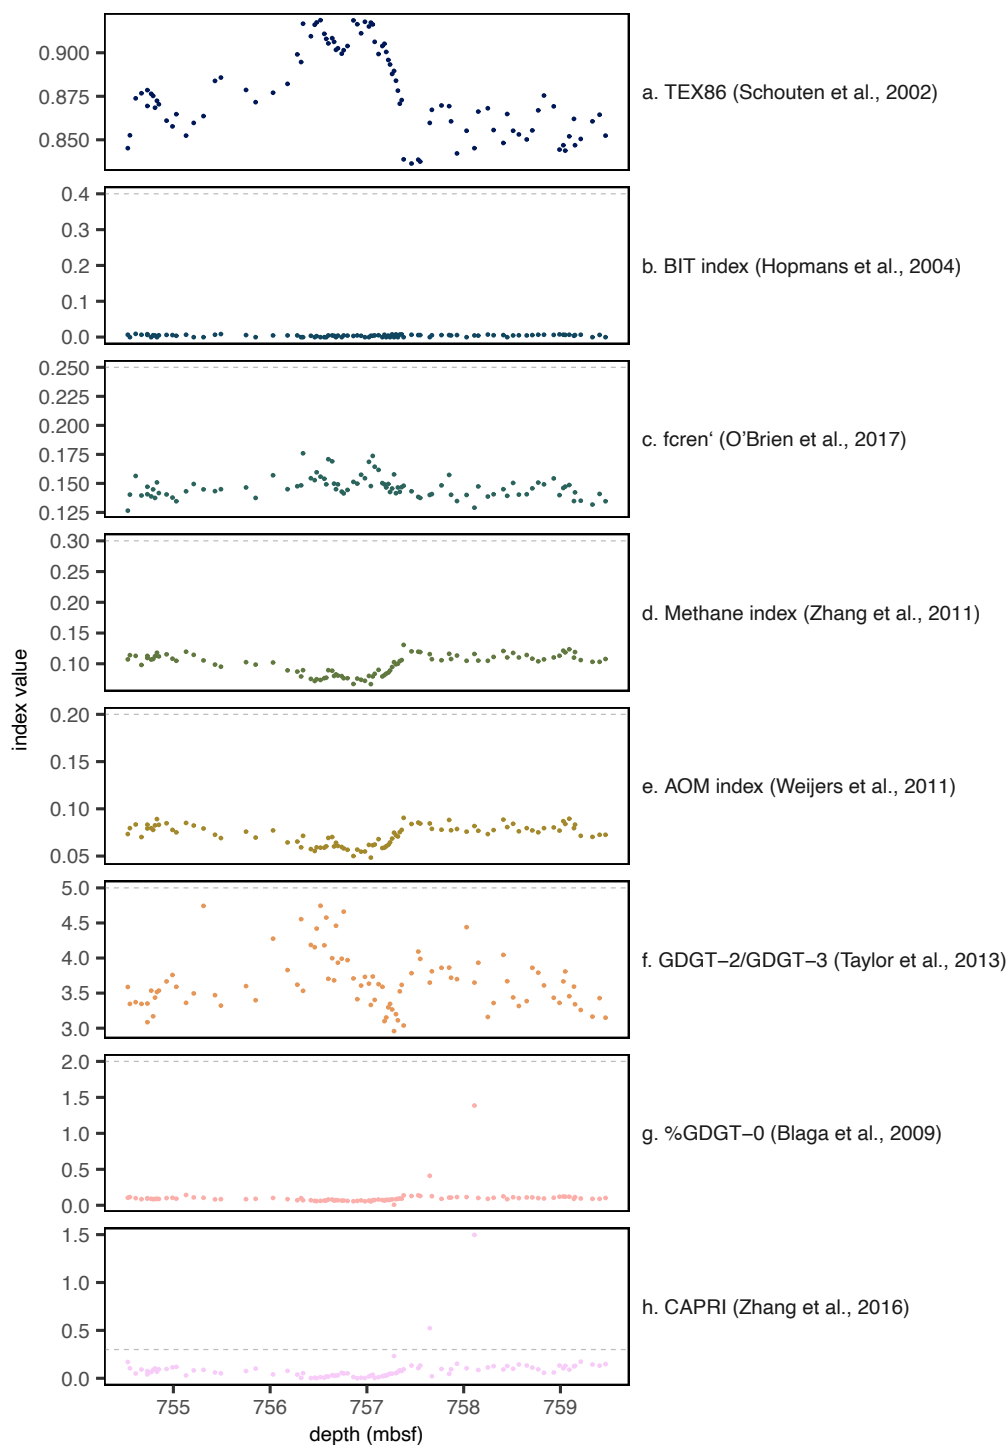

Figure S2. GDGT ratios and indices for identification of non-thermal overprinting on the TEX₈₆. Figure generated with (modified) R-script by (Bijl et al., 2021) and includes ratios and indices from (Blaga et al., 2009; Hopmans et al., 2004; O'Brien et al., 2017; Schouten et al., 2002; Taylor et al., 2013; Weijers et al., 2011; Zhang et al., 2011, 2016).
