Abstract

To our knowledge this is the first published case of NP associated with COVID-19 in an individual with CF and the first associated with *Nocardia* infection. We suspect the combination of cystic fibrosis, COVID-19 pneumonitis and co-infection with *Nocardia farcinia* caused this young man's NP and ultimately his untimely death. We hope this case will highlight individuals with CF of all ages are at risk of severe COVID-19 infection.
