Abstract

Background: Coiled coil domain containing protein 51 (CCDC51), as the two transmembrane helical domains protein, little is known about the function of it in human cancer. Methods: TCGA, GEPIA, cBioPortal, GTEx, and TIMER were employed to analyze expression, immune cells infiltration, prognostic value, genetic alteration, cancer patients' mutation burden, stem cell stability, and microsatellite instability of CCDC51. Results: Decreased CCDC51 expression significantly related with poor overall survival (OS) of acute myeloid leukemia (LAML), adrenocortical carcinoma (ACC), glioma (GBMLGG), kidney chromophobe (KICH), liver hepatocellular carcinoma (LIHC), lung squamous cell carcinoma (LUSC), skin cutaneous melanoma (SKCM) and uveal melanoma (UVM), lung adenocarcinoma (LUAD), disease-specific survival (DSS) of ACC, GBMLGG, SKCM and UVM, and progression-free interval (PFI) of ACC, KICH and pancreatic adenocarcinoma, squamous cell carcinoma of the head and neck (HNSC). In human cancer, immune cell infiltration, and tumor microenvironment, CCDC51 expression is associated with MSI, RNA modifications, and diverse cancer drug sensitivity. There is potential for it to be an independent factor contributing to OS in LIHC. CCDC51 was an independent factor for LIHC prognosis in Cox regression and nomogram analysis. The results of the the Kyoto Encyclopedia of Genes and Gene Ontology and Genomes indicated that CCDC51 was involved in aminoacyl-tRNA biosynthesis, RNA transport, colorectal cancer, Wnt signaling pathway, mismatch repair, mitochondrial inner membrane. Conclusion: Our research can provide new-insights for LIHC prognostic biomarkers of CCDC51.

16 Abstract

Background: Coiled coil domain containing protein 51 (CCDC51), as the two transmembrane helical domains protein, little is known about the function of it in human cancer.

Methods: TCGA, GEPIA, cBioPortal, GTEx, and TIMER were employed to analyze expression, immune cells infiltration, prognostic value, genetic alteration, cancer patients' mutation burden, stem cell stability, and microsatellite instability of CCDC51.

Results: Decreased CCDC51 expression significantly related with poor overall 24 survival (OS) of acute myeloid leukemia (LAML), adrenocortical carcinoma (ACC), 25 glioma (GBMLGG), kidney chromophobe (KICH), liver hepatocellular carcinoma 26 27 (LIHC), lung squamous cell carcinoma (LUSC), skin cutaneous melanoma (SKCM) and uveal melanoma (UVM), lung adenocarcinoma (LUAD), disease-specific survival 28 (DSS) of ACC, GBMLGG, SKCM and UVM, and progression-free interval (PFI) of 29 ACC, KICH and pancreatic adenocarcinoma, squamous cell carcinoma of the head 30 31 and neck (HNSC). In human cancer, immune cell infiltration, and tumor microenvironment, CCDC51 expression is associated with MSI, RNA modifications, 32 33 and diverse cancer drug sensitivity. There is potential for it to be an independent factor contributing to OS in LIHC. CCDC51 was an independent factor for LIHC 34 prognosis in Cox regression and nomogram analysis. The results of the the Kyoto 35 Encyclopedia of Genes and Gene Ontology and Genomes indicated that CCDC51 was 36 involved in aminoacyl-tRNA biosynthesis, RNA transport, colorectal cancer, Wnt 37 signaling pathway, mismatch repair, mitochondrion, pseudo uridine synthase activity, 38 mRNA processing, mitochondrial matrix, regulation of mRNA stability, and 39 mitochondrial inner membrane. 40

41 Conclusion: Our research can provide new-insights for LIHC prognostic biomarkers
42 of CCDC51.

Keywords: Pan-cancer, CCDC51, Liver hepatocellular carcinoma, Prognostic value,
RNA modification, Immune cell infiltration

46 Background

Liver hepatocellular carcinoma (LIHC) is a multiple malignant tumor in the world[1]. 47 48 The mortality rate of malignant tumor ranks fourth in the world, and ranks second in 49 China[1,2]. There has been a gradual upward trend last several years. The onset of liver cancer is hidden, most of the patients often miss the best time for surgical 50 treatment[3]. Relying solely on chemotherapy, whether single drug or combined 51 radiotherapy and chemotherapy, the effect is not ideal, resulting in poor efficacy and 52 53 high mortality of LIHC^[4]. Elucidating the specific biomarkers in the process of LIHC development has critical research significance for early diagnosis and 54 individual drug use of LIHC patients. 55

56 Coiled coil domain containing protein 51 (CCDC51), presents the pore-forming 57 subunit of a mitoK (ATP) channel, alias MITOK [5]. It has been reported CCDC51 58 related to retinal disease [5]. However, the CCDC51 role in pan-cancer diagnosis, 59 prognosis, RNA modification, and immune regulation remains unclear.

In this study, we investigated the role of CCDC51 in pan-cancer, and we clarified the relationship between the expression of CCDC51 and the expression of RNA modification regulators, DNA microsatellite instability (MSI), immune cell infiltration in human cancer, and drug sensitivity, tumor mutational burden (TMB). It is a promising molecular target for LIHC as well as a potential biomarker for diagnosis and prognosis of different cancer types .

66

67 Materials and methods

68 Pan-cancer expression of CCDC51

69 Tumor Immune Estimation Resource (TIMER) (https://cistrome.shinyapps.io/timer/)[6], 70 Cancer Genome Atlas (TCGA) (https://www.cancer.gov/about-nci/organization/ccg/research/structural-genomics/tcga) 71 Genotype-Tissue Expression (GTEx) database and UALCAN 72 database 73 (http://ualcan.path.uab.edu/)[7] were used to examine the expression of CCDC51 in pan-cancer tissue (ns, p≥0.05; *, p<0.05; **, p<0.01; ***, p<0.001). 74 The prognosis and clinical information of CCDC51 in pan-cancer 75

- 76 We employed the GEPIA databases (http://gepia.cancer-pku.cn/)[8] and PrognoScan
- databases (http://dna00.bio.kyutech.ac.jp/PrognoScan/index.html)[9] to examine the
- 78 OS, DSS and PFI of CCDC51 in pan-cancer. (ns, $p \ge 0.05$; *, p < 0.05; **, p < 0.01;
- 79 ***, p < 0.001).
- 80 Mutations of CCDC51 in pan-cancer
- 81 We conducted on the pan-cancer CCDC51 gene mutation information via
- 82 cBioPortal (https://www.cbioportal.org/)[10].
- 83 The relationship between RNA modification of CCDC51 in pan-cancer

From the UCSC databases (https://xenabrowser.net/), we downloaded the TCGA TARGET GTEx (PANCAN,N=19131,G=60499) pan-cancer data set. From the previous study, we extracted the expression data of ENSG00000164051 (CCDC51) gene in each sample [11].

- 88 GeneMANIA and STRING databases
- In order to construct the gene-gene and protein-protein interactions network of
 CCDC51, GeneMANIA (http://www.genemania.org) and STRING
 (https://string-db.org/) were used.
- 92 Correlation between CCDC51 and cancer drug sensitivity

GDSC (www.cancerRxgene.org) and CTRP (http://portals.broadinstitute.org/ctrp/)
databases were used to analyze the correlation between CCDC51 and drug
susceptibility [12,13].

96

97 **Results**

98 CCDC51 was differentially expressed in pan-cancer

99 First, TIMER database analysis was excavated to examine the CCDC51 expression

100 level in pan-cancers. CCDC51 expression was increased in breast invasive carcinoma

- 101 (BRCA) and cholangiocarcinoma (CHOL), cancer of the cervical squamous cell and
- 102 endocervical adenocarcinoma (CESC), bladder urothelial carcinoma (BLCA),
- 103 glioblastoma multiforme (GBM), head and neck squamous cell carcinoma (HNSC),
- 104 colon adenocarcinoma (COAD), liver hepatocellular carcinoma (LIHC), esophageal

105 carcinoma (ESCA), kidney renal papillary cell carcinoma (KIRP), prostate 106 adenocarcinoma (PRAD), lung adenocarcinoma (LUAD), lung squamous cell 107 carcinoma (LUSC), rectum adenocarcinoma (READ), uterine corpus endometrial 108 carcinoma (UCEC) and stomach adenocarcinoma (STAD) tissues compared with 109 adjacent normal tissues. Furthermore, CCDC51 expression was low in kidney renal 110 clear cell carcinoma (KIRC), kidney chromophobe (KICH), and thyroid 111 carcinoma.(Figure 1A).

112 Next, we combined the GTEx and TCGA database, and the results proved that CCDC51 expression was significantly increased in COAD, BRCA, CESC, BLCA, 113 CHOL, ESCA, lymphoid neoplasm diffuse large B-cell lymphoma (DLBC), KIRP, 114 GBM, pancreatic adenocarcinoma (PAAD), HNSC, LUAD, brain lower grade glioma 115 (LGG), LIHC, READ, STAD, LUSC, ovarian serous cystadenocarcinoma (OV), skin 116 cutaneous melanoma (SKCM), UCEC, esticular germ cell tumors (TGCT), THCA, 117 thymoma (THYM), and uterine carcinosarcoma (UCS) than in paired adjacent normal 118 (Figure 1B). 119

To investigate the expression leve of CCDC51 protein in human cancers, we used
UALCAN database analysis and found that CCDC51 was highly expressed in LIHC,
BRCA, UCE and LUAD. In addition, we found that CCDC51 was down-regulated in

123 RCC, PAAD, and GBM (Figure 1C).

124 Prognosis values of CCDC51 in pan-cancer

The prognostic ability of CCDC51 in pan-cancer was examined due to the fact that it is expressed differently in many cancer types. Increased CCDC51 expression correlated with poor OS in ACC, LIHC, glioma (GBMLGG), KICH, LAML, LUSC, SKCM, LUAD and UVM (Figure 2A), and poor DSS in ACC, GBMLGG, SKCM,

129 UVM (Figure 2B), and poor PFI in ACC, HNSC, KICH, and PAAD (Figure 2C).

130 CCDC51 could act as a potential biomarker in pan-cancer

A biomarker for pan-cancer using CCDC51 is being investigated. The analysis of ROC curve was conducted, and the results indicated that CCDC51 can be used as a high sensitivity and specificity biomarker (AUC>0.75) for diagnosing BRCA, CESC,

134 CHOL, COAD, colon adenocarcinoma, rectum adenocarcinoma, esophageal

135 carcinoma (COADREAD), brain lower grade glioma (LGG), DLBC, ESCA,

136 GBMLGG, GBM, HNSC, KIRC, OV, KIRP, LAML, LIHC, LUAD, LUSC, PAAD,

137 TGCT, PRAD, READ, SKCM, STAD, THYM, UCEC and UCS (Figure 3A–E).

138 Gene mutation landscape and DNA methylation of CCDC51 in pan-cancer

139 We download the mutational data of CCDC51 from the cBioPortal. In mature B-cell neoplasms, KIRC, endometrial cancer, and melanoma, mutation rates were higher 140 than in other cancers (Figure 4A), and amplification was the most common alteration 141 142 type. Using the cBioPortal database, 51 missense sites and 7 truncation sites between amino acids 0 and 411 were identified in CCDC51 (Figure 4C). CCDC51 expression 143 was negatively correlated with DNA methylation in BLCA, CESC, COAD, ESCA, 144 KIRP, LIHC, LUAD, LUSC, PAAD, PRAD, READ, THCA and UCEC (Figure 4D). 145 It appears that CCDC51 genetic alterations and DNA methylation affect its prognostic 146 ability. 147

148 TMB and MSI analysis of CCDC51 in pan-cancer

TMB has been recognized as a specific and sensitive biomarker for immune checkpoint inhibitor responses by scholars[14-16]. The expression of CCDC51 and TMB of pan-cancer was investigated. In STAD, PAAD, UCS, HNSC, PRAD, LGG, SKCM, UCEC, KICH, BLCA, LIHC, THYM, UVM, DLBC, KIRC, COAD, LUAD, KIRP, LUSC, READ and ESCA, CCDC51 expression was positively correlated with TMB. BRCA, CESC, PCPG, OV, LAML, THCA and CHOL were negatively correlated with TMB (Figure 5A).

- Lack of DNA repair activity causes a hypervariable state of DNA sequence[17]. Wealso analyzed the correlation between CCDC51 expression and MSI in pan-cancer.
- 158 The expression of CCDC51 was positively correlated with MSI in TGCT, STAD,
- 159 DLBC, KIRC, UCEC, and CHOL, THYM, UVM, LIHC, GBM, KIRP, COAD, LUSC,
- 160 BLCA, SARC, HNSC, and ESCA, whereas PCPG, MESO, UCS, LUAD, PAAD,
- 161 KICH, ACC, READ, LAML, LGG, SKCM, PRAD, and THCA were negatively
- 162 correlated with MSI (Figure 5B). Collectively, these results indicate that CDCC51
- 163 influences antitumor immunity.
- 164 Pan-Cancer Immune Cell Infiltration of CCDC51

progression relies heavily on immune cells [18]. 165 Cancer Using the TIMER database, the infiltration levels of T cells CD8+, CD4+, neutrophils, myeloid 166 dendritic cells, macrophages, expression of B cells and CCDC51 were examined in 32 167 types of cancers. In 27 types of cancer, CCDC51 expression was significantly 168 169 correlated with the six major immune cells (Figure 6A). In our study of the relationship between CCDC51 expression and immune cell subtypes, we found that 170 171 CCDC51 expression was significantly correlated with matrix score in 22 cancers, 172 microenvironment score in 24 cancers, immune score in 19 cancers, and immune score in 38 cancers (Figure 6b). The results showed a close relationship between 173 CCDC51 expression and immune cell infiltration in pan-cancer. 174

175 RNA modification and drug sensitivity analysis of CCDC51 in pan-cancer

176 RNA modification has an important role in normal development and 177 tumorigenesis[19,20]. TCGA TARGET GTEx was used to assess the correlation 178 between RNA modification regulators and CCDC51 expression in pan-cancer. There 179 is a correlation between CCDC51 expression and RNA modification regulators in 180 pan-cancer. CCDC51 expression was markedly correlated with m1A, m5C and m6A 181 in many types of cancers (Figure 7A).

The correlation between CCDC51 expression and drug sensitivity was evaluated 182 using cancer cell lines from the Genomics of Drug Sensitivity in Cancer (GDSC) 183 184 database and the Cancer Therapeutics Response Portal (CTRP) database. According to the GDSC database, CCDC51 expression was positively correlated with 185 CHIR-99021, Foretinib, Pazopanib, SN-38, YM155, and ZG-10, and negatively 186 correlated with 5-Fluorouracil, CI-1040, PD-0325901, RDEA119, Trametinib, 187 VX-11e, and selumetinib. In the CTRP database, The expression of CCDC51 was 188 positively associated with ABT-199, AT7867, AZD4547, Ki8751, ML162, ML239, 189 NSC23766, TG-100-115, UNC0638, Acitinib and Cytochalasin B, Fluvastatin, 190 Lenvatinib, Olaparib and Staurosporine. Negative correlation was observed with 191 BMS-345541, COL-3, GW-405833, N9-isoproploxine, SCH-79797, Afatinib, 192 193 Austocystinn D, Elotinib, Fluorouracil, Linifanil, Methotrexate, Pandacostat, Pifithrin-mu, and Valdecoxib. 194

195 According to the above results, it is expected that CCDC51 will be a promising cancer

196 therapeutic target because it is significantly related to drug sensitivity in cancer cells.

197 Interaction network of CCDC51 at the gene and protein levels

Using STRING, we conducted CCDC51 protein–protein interaction network of the seed gene. As expected, several nodes (11) and edges (19) were obtained in the PPI network (Figure 8 A). The gene–gene interaction network of CCDC51 is generated through GeneMANIA as presented in Fig. 8B.

202 Prognostic analysis of CCDC51 in LIHC

An analysis was conducted to uncover the relationship between CCDC51 expression 203 and LIHC pathology. MN stage, tumor status, gender, weight, BMI, and residual 204 tumour were strongly associated with overexpression of CCDC51 (Figure 9A). High 205 206 CCDC51 expression was associated with poorer OS for LIHC in most clinical and demographic subgroups. They included pathologic stage (III&IV), histologic grade 207 (G3&G4), adjacent tissue inflammation, fibrosis ishak score, age (>60), gender 208 (female), race(white), weight (>70kg) (Figure 9B). To determine whether CCDC51 209 210 level could be used as a prognostic factor in LIHC patients, a multivariate Cox regression analysis was performed. The TCGA LIHC cohort showed that decreased 211 212 CCDC51 expression and pathological stage were independent prognostic 213 factors(Tables 1–3).

214 LIHC functions of CCDC51

To analysis KEGG and GO enrichment, top 50 similar genes were captured in GEPIA 215 database (Figures 10A). For the KEGG enrichment, these genes mainly covered in 216 aminoacyl-tRNA biosynthesis, RNA transport, colorectal cancer, Wnt signaling 217 pathway, and mismatch repair (Figures 10B). GO enrichment results showed that 218 these genes mainly covered in mitochondrion, pseudo uridine synthase activity, 219 mRNA processing, mitochondrial matrix, regulation of mRNA stability, and 220 mitochondrial inner membrane (Figures 10C). Findings show that CCDC51 plays a 221 critical role in regulating LIHC malignant progression. 222

223 Discussion

224 Pan cancer analysis is critical to compare heterogeneity between different tumors for

identifying novel cancer biomarkers and therapeutic targets[21]. CCDC51 has been
demonstrated to be involved in retinal disease [5]. Currently, no studies have tested
whether CCDC51 is associated with cancer prognosis.

In this research, we analyzed CCDC51 expression in pan-cancer. CCDC51 expression 228 229 was significantly higher in BLCA, CHOL, COAD, CESC, DLBC, ESCA, BRCA, GBM, KIRP, LGG, LUAD, HNSC, LUSC, OV, LIHC, SKCM, PAAD, READ, 230 THYM, UCEC, STAD, TGCT, THCA, and UCS than in paired adjacent normal 231 232 tissues. In addition, our result indicated high CCDC51with poor OS for LIHC, ACC, GBMLGG, LAML, LUAD, LUSC, KICH, SKCM, and UVM, poor DSS in ACC, 233 GBMLGG, SKCM, and UVM, and poor PFI in ACC, HNSC, KICH, and PAAD. 234 ROC curve analysis indicated that CCDC51 could be used as a biomarker for the 235 236 diagnosis of different types of cancer, with high sensitivity and specificity. Additionally, our team ensured the relationship between CCDC51 and mutation. We 237 found that mature B-Cell neoplasms patients had the highest alteration frequency of 238 CCDC51 (>6%). We also confirmed that alteration frequencies were 2.94%, 2.9%, 239 240 2.7%, and 2.02% in KIRC, endometrial cancer, melanoma, and colorectal cancer, respectively. Furthermore, DNA methylation of CCDC51 affects its prognostic ability. 241 242 TMB and MSI as an immunotherapy biomarker for cancer immune checkpoint inhibitors [15,16]. CCDC51 was correlated with TMB in 31 cancer types and MSI in 243 244 30 cancer types. Next, analyzed gene-gene and protein-protein interaction networks, and 10 proteins interacted with CCDC51, namely, SSBP3, TMA7, LAMP5, CCDC75, 245 ZNF251, IFT140, ZNF541, ARHGAP23, ADAMTS18 and PALD1. 246

LIHC is a multiple malignant tumor in the world, which is a serious threat to human health[1]. CCDC51 expression levels and pathological stage were independent prognostic factors in the TCGA, LIHC cohort.

In order to gain a deeper understanding of CCDC51's role in LIHC, KEGG and GO enrichment suggested that CCDC51 was involved in aminoacyl-tRNA biosynthesis, RNA transport, colorectal cancer, Wnt signaling pathway, mismatch repair, mitochondrion, pseudo uridine synthase activity, mRNA processing, mitochondrial matrix, regulation of mRNA stability, and mitochondrial inner membrane. 255 CCDC51 and pan-cancer are now better understood, but there are still some 256 unanswered questions. First of all, although we have explored the relationship 257 between CCDC51 and immune infiltration in pan-cancer, there is no experimental 258 evidence to confirm its role in immune regulation of TME in cancer. Secondly, in 259 vitro and in vivo studies of CCDC51's potential role in cancer development are 260 needed.

261 Conclusion

262 To sum up, we revealed the potential function of CCDC51 in pan-cancer. Additionally,

263 CCDC51 expression was associated with pan-cancer prognosis, diagnosis, TMB,

264 RNA modification, MSI, and immune infiltration. A reduction in CCDC51 expression

265 was an independent prognostic factor in the TCGA-LIHC cohort and was directly

- related to improved OS, DSS, and PFS. CCDC51 can therefore be used to assess the
- 267 prognosis of cancer patients and as a therapeutic target for LIHC diagnosis.

268 Data Availability

269 The data used to support the findings of this study are included within the article. The data

- and materials in the current study are available from the corresponding author on reasonable
- 271 request.

272 Conflicts of Interest

273 The authors declare no conflicts of interest.

274 Author contributions

All authors participated in the interpretation of the studies, analysis of the data, and review of the manuscript. XYH, and SYW contributed to the study conception and design. SYW, PC, ZC contributed to the data analysis. The first draft of the manuscript was written by SYW, and XYH. All authors read and approved the final manuscript.

349 pan-cancer expression of CCDC51 from the TCGA/GTEx database. (C) A pan-cancer

analysis of CCDC51 by UALCAN.

351 ACC, adrenocortical carcinoma; BLCA, bladder urothelial carcinoma; BRCA, breast invasive 352 carcinoma; CESC, cervical squamous cell carcinoma and endocervical adenocarcinoma; CHOL, 353 cholangiocarcinoma; COAD, colon adenocarcinoma; DLBC, lymphoid neoplasm diffuse large 354 B-cell lymphoma; ESCA, esophageal carcinoma; GBM, glioblastoma multiforme; HNSC, head 355 and neck squamous cell carcinoma; KICH, kidney chromophobe; KIRC, kidney renal clear cell 356 carcinoma; KIRP, kidney renal papillary cell carcinoma; LAML, acute myeloid leukemia; LGG, 357 brain lower grade glioma; LIHC, liver hepatocellular carcinoma; LUAD, lung adenocarcinoma; 358 LUSC, lung squamous cell carcinoma; MESO, mesothelioma; OV, ovarian serous cystadenocarcinoma; PAAD, pancreatic adenocarcinoma; PCPG, pheochromocytoma and 359 360 paraganglioma; PRAD, prostate adenocarcinoma; READ, rectum adenocarcinoma; SARC, 361 sarcoma; SKCM, skin cutaneous melanoma; STAD, stomach adenocarcinoma; TGCT, testicular 362 germ cell tumors; THCA, thyroid carcinoma; THYM, thymoma; UCEC, uterine corpus 363 endometrial carcinoma; UCS, uterine carcinosarcoma; UVM, uveal melanoma. ns, p > 0.05, *p < 364 0.05, **p < 0.01, ***p < 0.001.

FIGURE 2. Prognosis values for pan-cancer were correlated with CCDC51
 expression.

- 368 (A) Survival for CCDC51 in ACC, GBMLGG, KICH, LAML, LIHC, LUAD, LUSC,
- 369 SKCM, and UVM. (B) CCDC51 disease-specific survival in ACC, GBMLGG,
- 370 SKCM, and UVM. (C) The progress free interval for CCDC51 in ACC, HNSC, KICH,
- and PAAD.
- 372

FIGURE 3. A potential biomarker for human cancer may be CCDC51.

A ROC curve analysis of CCDC51 expression predicts prognosis in BRCA, CESC,
CHOL, and COAD (A); COADREAD, DLBC, ESCA, and GBM (B); GBMLGG,
HNSC, KIRC, and KIRP (C); LAML, LGG, LIHC, and LUAD (D); LUSC, OV,
PAAD, and PRAD (E); READ, SKCM, STAD, and TGCT (F); THYM, UCEC, and
UCS (G).

381

FIGURE 4. Mutational and DNA methylation analysis of CCDC51.

(A) Summary of mutation types of CCDC51 and the distribution among different
cancers. (B) The cBioPortal database examined the frequency of mutation in CCDC51
in pan-cancer. (C) Hot spots of mutation of CCDC51. (D) Correlation between
CCDC51 expression and DNA methylation.

FIGURE 5. The relationship between CCDC51 expression and TMB and MSI.

- 390 (A) Correlation between CCDC51 and TMS in pan-cancer. (B) Correlation between
- 391 CCDC51 and MSI in pan-cancer.

FIGURE 6. Relationship between CCDC51 expression and immune infiltration. 395

(A) The correlations between CCDC51 expression and immunoinvasive level in 33 396 human tumors using TIMER. (B) Correlation between CCDC51 expression and 397 immune invasion levels in 33 human tumors using xCell. *p <0.05, **p < 0.01, ***p 398 < 0.001. 399

FIGURE 7. An analysis of the correlation between CCDC51 expression and RNA
modification, as well as drug sensitivity in pan-cancer.

405 (A) Correlations between CCDC51 expression and and RNA modification. (B) 406 Analyzing drug sensitivity in diverse human cancers using the GDSC database. (C) 407 CTRP database analysis of CCDC51 expression and drug sensitivity in different 408 human cancers. *p < 0.05.

412 FIGURE 8. Interaction network of CCDC51 at the gene and protein levels.

- 413 (A) Protein–protein interaction network of individual CCDC51 (STRING database).
- 414 (B) Gene–gene interaction network of individual CCDC51 (GeneMANIA database).
- 415

- 416
- 417

418 FIGURE 9. Prognostic analysis of CCDC51 in LIH.

(A) The correlation between CCDC51 expression and Clinical Characteristics in
LIHC. (B) The correlation between CCDC51 and OS in different clinical subgroups
of LIHC.

FIGURE 10. CCDC51 functional enrichment analysis in LIHC. 425

(A) Hot map of the top 50 similar genes with CCDC51 in LIHC. (B) KEGG of 426

CCDC51 analysis by using the first 50 similar genes. (C) The GO term of CCDC51 427

- analysis by using the first 50 similar genes. 428
- 429

Table 1. Univariate and multivariate Cox regression analyses of different parameterson OS in LIHC.

.		Univariate analysis		Multivariate analysis
