## Summary

This paper is devoted to studying the existence of of renormalized solution for an initial boundary problem of a quasilinear parabolic problem with variable exponent and $L^{1}$-data of the type

$$
\begin{cases}(b(u))_{t}-\operatorname{div}\left(|\nabla u|^{p(x)-2} \nabla u\right)+\lambda|u|^{p(x)-2} u=f(x, t, u) & \text { in } \quad Q=\Omega \times] 0, T[, \\ u=0 & \text { on } \quad \Sigma=\partial \Omega \times] 0, T[, \\ b(u)(t=0)=b\left(u_{0}\right) & \text { in } \Omega,\end{cases}
$$

where $\lambda>0$ and $T$ is positive constant. The results of the problem discussed can be applied to a variety of different fields in applied mathematics for example in elastic mechanics, image processing and electro-rheological fluid dynamics, etc..

## KEYWORDS:

Quasilinear parabolic problems; variable exponent; truncations; renormalized solutions; $L^{1}$ data.

## 1 | INTRODUCTION

In recent years, there are a lot of interest in the study of various mathematical problems with variable exponent (see for example $[8,11,16,20]$ and references therein), the problems with variable exponent are interesting in applications and raise many difficult mathematical problems, some of the models leading to these problems of this type are the models of motion of electrorheological fluids, the mathematical models of stationary thermo-rheological viscous fows of non-Newtonian fluids and in the mathematical description of the processes filtration of an ideal barotropic gas through a porousmedium we refer the reader for example to ${ }^{9}$. In the classical case $(p()=$.2 or $p()=$.$p (a constant)$, we recall that the notion of renormalized solutions was introduced by Di Perna and Lions ${ }^{10}$ in their study of the Boltzmann equation.
It has been studied by many authors under various conditions on the data the existence and uniqueness of the renormalized solution for parabolic equations with $L^{1}$-data in the classical Sobolev spaces ( $\operatorname{see}^{4},,^{[17]}$ and ${ }^{[2]}$ ).
In Sobolev space with variable exponents, the authors ${ }^{[11}$ have proved the existence of renormalized solutions for a class of nonlinear parabolic systems with variable exponents and, for the corresponding parabolic equations with $L^{1}$ data, the authors in ${ }^{8}$ have proved the existence and uniqueness of renormalized solution to nonlinear parabolic equations with variable exponents and, in ${ }^{[20}$ have proved an existence and uniqueness results renormalized solutions and entropy solutions for nonlinear parabolic equations with variable exponents and $L^{1}$ data. And moreover, we obtain the equivalence of renormalized solutions and entropy solutions. On the other hand in ${ }^{[16}$ S.Ouaro and all obtains existence and uniqueness of entropy solutions to nonlinear parabolic
equation with variable exponent and $L^{1}$-data. The functional setting involves Lebesgue and Sobolev spaces with variable exponents .
In the present paper, we establish the existence of a renormalized solution for a class of a quasilinear parabolic problem of type

$$
\begin{cases}(b(u))_{t}-\operatorname{div} \mathcal{A}(x, t, \nabla u)+\gamma(u)=f(x, t, u) & \text { in } \quad Q=\Omega \times] 0, T[  \tag{1}\\ u=0 & \text { on } \quad \Sigma=\partial \Omega \times] 0, T[ \\ b(u)(t=0)=b\left(u_{0}\right) & \text { in } \Omega\end{cases}
$$

In the problem (1], $\Omega$ be a bounded domain of $\mathbb{R}^{N}(N \geq 2)$ with lipshitz boundedary $\partial \Omega$ and $\left.Q=\Omega \times\right] 0, T[$ for any fixed $T$ is a positive real number. Let $p: \bar{\Omega} \rightarrow[1,+\infty)$ be a continuous rel-valued function and let $p^{-}=\min _{x \in \bar{\Omega}} p(x)$ and $p^{+}=\max _{x \in \bar{\Omega}} p(x)$ with $1<p^{-} \leq p^{+}<N$. Let $-\operatorname{div} \mathcal{A}(x, t, \nabla u)=-\operatorname{div}\left(|\nabla u|^{p(x)-2} \nabla u\right)$ is a Leary-Lions operator (see assumption (8)- (10)), respectively, $\gamma: \mathbb{R} \rightarrow \mathbb{R}$ with $\gamma(u)=\lambda|u|^{p(x)-2} u$ is a continuous increasing function for $\lambda>0$ and $\gamma(0)=0$ such that $\gamma(u)$ is assumed to belong to $L^{1}(Q)$. The function $f: Q \times \mathbb{R} \rightarrow \mathbb{R}$ be a Carathéodory function (see assumptions (12)-(13)). Finally the function $b: \mathbb{R} \rightarrow \mathbb{R}$ is a strictly increasing $C^{1}$-function lipchizienne with $b(0)=0$ (see $\sqrt{11 p}$ ), the data $f(x, t, u)$ and $b\left(u_{0}\right)$ is in $L^{1}(Q)$.
For the quasilinear parabolic problem with variable exponent and $L^{1}$ data of (1) the existence of renormalized solution, this result can be seen as a generalization of the result in classical sobolev space obtained by S. Fairouz and all in ${ }^{[12}$ in the case where $b(u)=u$ and $u_{0} \in L^{1}(\Omega)$.
The paper is organized as follows: In section 2, we give some preliminaries and basic assumptions. In section 3, we give the definition of a renormalized solution of (1), and we establish (Theorem (1) ) the existence of such a solution.

## 2 | ASSUMPTIONS ON DATA AND PRELIMINARIES

## 2.1 | Functional spaces

In this section, we first state some elementary results for the generalized Lebesgue spaces $L^{p(.)}(\Omega), W^{1, p(.)}(\Omega)$ and the generalized Lebesgue-Sobolev spaces $W_{0}^{1, p(.)}(\Omega)$ where $\Omega$ is an open subset of $\mathbb{R}^{N}$. We refer to Fan and Zhao ${ }^{13}$ for further properties of Lebesgue Sobolev spaces with variable exponents. Let $p: \bar{\Omega} \rightarrow[1,+\infty)$ be a continuous rel-valued function and let $p^{-}=\min _{x \in \bar{\Omega}} p(x), p^{+}=\max _{x \in \bar{\Omega}} p(x)$ with $1<p()<$.$N . We denote the Lebesgue space with variable exponent L^{p(.)}(\Omega)$ as the set of all measurable function $u: \Omega \rightarrow \mathbb{R}$ for which the convex modular

$$
\begin{equation*}
\rho_{p(.)}(u)=\int_{\Omega}|u|^{p(x)} d x \tag{2}
\end{equation*}
$$

is finite. If the exponent is bounded, i.e., if $p+<+\infty$, then the expression

$$
\begin{equation*}
\|u\|_{L^{p(.)}(\Omega)}=\inf \left\{\mu>0 ; \int_{\Omega}\left|\frac{u(x)}{\mu}\right|^{p(x)} d x \leq 1\right\} \tag{3}
\end{equation*}
$$

defines a norm in $L^{p(.)}(\Omega)$ called the Luxembourg norm. The space $\left(L^{p(.)}(\Omega) ;\|\cdot\|_{p(.)}\right)$ is a separable Banach space. Moreover, if $1<p^{-} \leq p+<+\infty$, then $L^{p(.)}(\Omega)$ is uniformly convex, hence reflexive and its dual space is isomorphic to $L^{p \prime(.)}(\Omega)$, where $\frac{1}{p(x)}+\frac{1}{p^{\prime}(x)}=1$, for $x \in \Omega$.
The following inequality will be used later:

$$
\begin{equation*}
\min \left\{\|u\|_{L^{p())}(\Omega)}^{p^{-}},\|u\|_{L^{p(.)}(\Omega)}^{p^{+}}\right\} \leq \int_{\Omega}|u(x)|^{p(x)} d x \leq \max \left\{\|u\|_{L^{p(.)}(\Omega)}^{p^{-}},\|u\|_{L^{p(\cdot)}(\Omega)}^{p^{+}}\right\} . \tag{4}
\end{equation*}
$$

Finally, we have the Holder type inequality

$$
\begin{equation*}
\left|\int_{\Omega} u v d x\right| \leq\left(\frac{1}{p^{-}}+\frac{1}{p^{+}}\right)\|u\|_{p(\cdot)}\|v\|_{p^{\prime}(.)}, \tag{5}
\end{equation*}
$$

for all $u \in L^{p(.)}(\Omega)$ and $v \in L^{p^{\prime}(.)}(\Omega)$.

Let

$$
\begin{equation*}
W^{1, p(.)}(\Omega)=\left\{u \in L^{p(.)}(\Omega),|\nabla u| \in L^{p(.)}(\Omega)\right\}, \tag{6}
\end{equation*}
$$

which is Banach space equiped with the following norm

$$
\begin{equation*}
\|u\|_{1, p(\cdot)}=\|u\|_{p(.)}+\|\nabla u\|_{p(.)} . \tag{7}
\end{equation*}
$$

The space $\left(W^{1, p(.)}(\Omega) ;\|\cdot\|_{1, p(.)}\right)$ is a separable and reflexive Banach space. An important role in manipulating the generalized Lebesgue and Sobolev spaces is played by the modular $\rho_{p(.)}$ of the space $L^{p(.)}(\Omega)$. We have the following result:

Proposition 1. If $u_{n}, u \in L^{p(.)}(\Omega)$ and $p+<+\infty$, the following properties hold true.
(i) $\|u\|_{p(.)}>1 \Rightarrow\|u\|_{p(.)}^{p+}<\rho_{p(.)}(u)<\|u\|_{p(.)}^{p-}$,
(ii) $\|u\|_{p(.)}<1 \Rightarrow\|u\|_{p(.)}^{p-}<\rho_{p(.)}(u)<\|u\|_{p(.)}^{p+}$,
(iii) $\|u\|_{p(.)}<1($ respectively $=1,>1) \stackrel{p(0)}{\Longleftrightarrow} \rho_{p(.)}(u)<1($ respectively $=1,>1)$,
(iv) $\left\|u_{n}\right\|_{p(.)} \rightarrow 0$ ( respectively $\left.\rightarrow+\infty\right) \Longleftrightarrow \rho_{p(.)}\left(u_{n}\right)<1$ ( respectively $\rightarrow+\infty$ ),
(v) $\rho_{p(.)}\left(\frac{u}{\|u\|_{p(.)}}\right)=1$.

For a measurable function $u: \Omega \rightarrow \mathbb{R}$, we introduce the following notation

$$
\rho_{1, p(.)}=\int_{\Omega}|u|^{p(x)} d x+\int_{\Omega}|\nabla u|^{p(x)} d x .
$$

Proposition 2. If $u \in W^{1, p(.)}(\Omega)$ and $p+<+\infty$, the following properties hold true.
(i) $\|u\|_{1, p(.)}>1 \Rightarrow\|u\|_{1, p(.)}^{p+}<\rho_{1, p(.)}(u)<\|u\|_{1, p(.)}^{p-}$,
(ii) $\|u\|_{1, p(.)}^{1, p()}<1 \Rightarrow\|u\|_{1, p(.)}^{p(.)}<\rho_{1, p(.)}(u)<\|u\|_{1, p(.)}^{p+}$,
(iii) $\|u\|_{1, p(.)}<1$ (respectively $\left.=1,>1\right) \Longleftrightarrow \rho_{1, p(.)}^{1, p(.)}(u)<1$ (respectively $=1,>1$ ).

Extending a variable exponent $p: \bar{\Omega} \rightarrow[1,+\infty)$ to $\bar{Q}=[0, T] \times \bar{\Omega}$ by setting $p(x, t)=p(x)$ for all $(x, t) \in \bar{Q}$.
We may also consider the generalized Lebesgue space

$$
L^{p(.)}(Q)=\left\{u: Q \rightarrow \mathbb{R} \text { mesurable such that } \int_{Q}|u(x, t)|^{p(x)} d(x, t)<\infty\right\}
$$

endowed with the norm

$$
\|u\|_{L^{p(.)}(Q)}=\inf \left\{\mu>0 ; \int_{Q}\left|\frac{u(x, t)}{\mu}\right|^{p(x)} d(x, t) \leq 1\right\}
$$

which share the same properties as $L^{p(.)}(\Omega)$.

## 2.2 | Assumptions

Let $\Omega$ be a bounded open set of $\mathbb{R}^{N}(N \geq 2), T>0$ is given and we set $\left.Q=\Omega \times\right] 0, T\left[\right.$, and $\mathcal{A}: Q \times \mathbb{R}^{N} \rightarrow \mathbb{R}^{N}$ be a Carathéodory function such that for all $\xi, \eta \in \mathbb{R}^{N}, \xi \neq \eta$

$$
\begin{gather*}
\mathcal{A}(x, t, \xi) \cdot \xi \geqslant \alpha|\xi|^{p(x)}  \tag{8}\\
|\mathcal{A}(x, t, \xi)| \leqslant \beta\left[L(x, t)+|\xi|^{p(x)-1}\right]  \tag{9}\\
(\mathcal{A}(x, t,, \xi)-\mathcal{A}(x, t, \eta)) \cdot(\xi-\eta)>0 \tag{10}
\end{gather*}
$$

where $1<p-\leq p+<+\infty, \alpha, \beta$ are positives constants and $L$ is a nonnegative function in $L^{p^{\prime}(.)}(Q)$ and $\gamma: \mathbb{R} \rightarrow \mathbb{R}$ is a continuous increasing function with $\gamma(0)=0$.

Let $b: \mathbb{R} \rightarrow \mathbb{R}$ is a strictly increasing $C^{1}$-function lipchizienne with $b(0)=0$ and for any $\rho, \tau$ are positives constants such that

$$
\begin{equation*}
\rho \leq b^{\prime}(s) \leq \tau, \quad \forall s \in \mathbb{R} \tag{11}
\end{equation*}
$$

$f: Q \times \mathbb{R} \rightarrow \mathbb{R}$ be a Carathéodory function such that for any $\sigma>0$, there exists $c \in L^{p^{\prime}(.)}(Q)$ such that

$$
\begin{equation*}
|f(x, t, s)| \leq c(x, t)+\sigma|s|^{p(x)-1} \tag{12}
\end{equation*}
$$

for almost every $(x, t) \in(Q), \quad s \in \mathbb{R}$,

$$
\begin{equation*}
f(x, t, s) s \geq 0 \tag{13}
\end{equation*}
$$

$$
\begin{equation*}
b\left(u_{0}\right) \in L^{1}(\Omega) \tag{14}
\end{equation*}
$$

## 3 | MAIN RESULTS

In this section, we study the existence of renormalized solutions to problem (1).
Definition 1. Let $2-\frac{1}{N+1}<p^{-} \leq p^{+}<N$ and $b\left(u_{0}\right) \in L^{1}(\Omega)$. A measurable function $u$ defined on $Q$ is a renormalized solution of problem (1) if,

$$
\begin{gather*}
T_{k}(u) \in L^{p^{-}}(] 0, T\left[; W_{0}^{1, p(.)}(\Omega)\right) \text { for any } k>0, \gamma(u), f(x, t, u) \in L^{1}(Q),  \tag{15}\\
\quad \text { and } b(u) \in L^{\infty}(] 0, T\left[; L^{1}(\Omega)\right) \cap L^{q^{-}}(] 0, T\left[; W_{0}^{1, q(.)}(\Omega)\right), \tag{16}
\end{gather*}
$$

for all continuous functions $q(x)$ on $\bar{\Omega}$ satisfying $q(x) \in\left[1, p(x)-\frac{N}{N+1}\right)$ for all $x \in \bar{\Omega}$,

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \int_{\{n \leq|u| \leq n+1\}} \mathcal{A}(x, t, \nabla u) \nabla u d x d t=0 \tag{17}
\end{equation*}
$$

and if, for every function $S \in W^{2, \infty}(\mathbb{R})$ which is piecewise $C^{1}$ and such that $S^{\prime}$ has compact support on $\mathbb{R}$, we have,

$$
\begin{gather*}
\left(B_{S}(u)\right)_{t}-\operatorname{div}\left(\mathcal{A}(x, t, \nabla u) S^{\prime}(u)\right)+S^{\prime \prime}(u) \mathcal{A}(x, t, \nabla u) \nabla u+\gamma(u) S^{\prime}(u)  \tag{18}\\
=f(x, t ; u) S^{\prime}(u) \text { in } \mathcal{D}^{\prime}(Q), \\
B_{S}(u)(t=0)=S\left(b\left(u_{0}\right)\right) \text { in } \Omega, \tag{19}
\end{gather*}
$$

where $B_{S}(z)=\int_{0}^{t} b^{\prime}(r) S^{\prime}(r) d r$.
The following remarks are concerned with a few comments on definition (1).
Remark 1. Note that, all terms in (18) are well defined. Indeed, let $k>0$ such that $\operatorname{supp}\left(S^{\prime}\right) \subset[K, K]$, we have $B_{S}(u)$ belongs to $L^{\infty}(Q)$ because

$$
\left|B_{S}(u)\right| \leq \int_{0}^{u}\left|b^{\prime}(r) S^{\prime}(r)\right| d r \leq \tau\left\|S^{\prime}\right\|_{L^{\infty}(\mathbb{R})}
$$

and $S(u)=S\left(T_{k}(u)\right) \in L^{p-}(] 0, T\left[; W_{0}^{1 ; p(.)}(\Omega)\right)$ and $\frac{\partial B_{S}(u)}{\partial t} \in \mathcal{D}^{\prime}(Q)$. The term $S^{\prime}(u) \mathcal{A}\left(x, t, \nabla T_{k}(u)\right)$ identifes with $S^{\prime}\left(T_{k}(u)\right) \mathcal{A}\left(x, t, \nabla\left(T_{k}(u)\right)\right)$ a.e. in $Q$, where $u=T_{k}(u)$ in $\{|u| \leq k\}$, assumptions (9) imply that

$$
\begin{gather*}
\left|S^{\prime}\left(T_{k}(u)\right) \mathcal{A}\left(x, t, \nabla T_{k}(u)\right)\right|  \tag{20}\\
\leq \beta\left\|S^{\prime}\right\|_{L^{\infty}(\mathbb{R})}\left[L(x, t)+\left|\nabla\left(T_{k}(u)\right)\right|^{p(x)-1}\right] \text { a.e in } Q .
\end{gather*}
$$

Using (9) and (15), it follows that $S^{\prime}(u) \mathcal{A}(x, t, \nabla u) \in\left(L^{p^{\prime}(.)}(Q)\right)^{N}$. The term $S^{\prime \prime}(u)$
$\mathcal{A}(x, t, \nabla u) \nabla(u)$ identifes with $S^{\prime \prime}(u) \mathcal{A}\left(t, x, \nabla\left(T_{k}(u)\right)\right) \nabla T_{k}(u)$ and in view of 97, 15) and 20), we obtain $S^{\prime \prime}(u) \mathcal{A}(x, t, \nabla u) \nabla(u) \in$ $L^{1}(Q)$ and $S^{\prime}(u) \gamma(u) \in L^{1}(Q)$. Finally $f(x, t, u) S^{\prime}(u)=f\left(x, t, T_{k}(u)\right) S^{\prime}(u)$ a.e in $Q$. Since $\left|T_{k}(u)\right| \leq k$ and $S^{\prime}(u) \in L^{\infty}(Q)$, $c(x, t) \in L^{p^{\prime}(.)}(Q)$, we obtain from 12 that $f\left(x, t, T_{k}(u)\right) S^{\prime}(u) \in L^{1}(Q)$.
We also have $\frac{\partial B_{S}(u)}{\partial t} \in L^{\left(p^{-}\right)^{\prime}}(] 0, T\left[; W^{-1, p^{\prime}(.)}(\Omega)\right)+L^{1}(Q)$ and $B_{S}(u) \in L^{p^{-}}(] 0, T\left[; W_{0}^{1, p(.)}(\Omega)\right) \cap L^{\infty}(Q)$, which implies that $B_{S}(u) \in C(] 0, T\left[; L^{1}(\Omega)\right)$.

Theorem 1. Let $b\left(u_{0}\right) \in L^{1}(\Omega)$, assume that $\left.(8)-14\right]$ hold true, then there exists at least one renormalized solution $u$ of problem (1) ( in the sens of Definition (1) ).

Proof. of Theorem (1) The above theorem is to be proved in five steps.

## - Step 1: Approximate problem and a priori estimates.

Let us define the following approximation of $b$ and $f$ for $\varepsilon>0$ fixed

$$
\begin{gather*}
b_{\varepsilon}(r)=T_{\frac{1}{\varepsilon}}(b(r)) \text { a.e in } \Omega \text { for } \varepsilon>0, \forall r \in \mathbb{R},  \tag{21}\\
b_{\varepsilon}\left(u_{0}^{\varepsilon}\right) \text { are a sequence of } C_{c}^{\infty}(\Omega) \text { functions such that }  \tag{22}\\
b_{\varepsilon}\left(u_{0}^{\varepsilon}\right) \rightarrow b\left(u_{0}\right) \text { in } L^{1}(\Omega) \text { as } \varepsilon \text { tends to } 0 \\
f^{\varepsilon}(x, t, r)=f\left(x, t, T_{\frac{1}{\varepsilon}}(r)\right) \tag{23}
\end{gather*}
$$

in view of (12) and (13), there exist $c_{\varepsilon} \in L^{p^{\prime}(.)}(Q)$ and $\sigma_{\varepsilon}>0$ such that

$$
\begin{equation*}
\left|f^{\varepsilon}(x, t, s)\right| \leq c_{\varepsilon}(x, t)+\sigma_{\varepsilon}|s|^{p(x)-1} \tag{24}
\end{equation*}
$$

for almost every $(x, t) \in(Q), \quad s \in \mathbb{R}$,

$$
\begin{equation*}
f^{\varepsilon}(x, t, s) s \geq 0 \tag{25}
\end{equation*}
$$

Let us now consider the approximate problem

$$
\begin{gather*}
\left(b_{\varepsilon}\left(u^{\varepsilon}\right)\right)_{t}-\operatorname{div} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right)+\gamma\left(u^{\varepsilon}\right)=f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) \text { in } Q,  \tag{26}\\
\left.u^{\varepsilon}=0 \text { on }\right] 0, T[\times \partial \Omega,  \tag{27}\\
b_{\varepsilon}\left(u^{\varepsilon}\right)(t=0)=b_{\varepsilon}\left(u_{0}^{\varepsilon}\right) \text { in } \Omega . \tag{28}
\end{gather*}
$$

As a consequence, proving existence of a weak solution $u^{\varepsilon} \in L^{p^{-}}(] 0, T\left[; W_{0}^{1, p(.)}(\Omega)\right)$ of $(26)-(28)$ is an easy task (see ${ }^{(15)}$ ). We choose $T_{k}\left(u^{\varepsilon}\right) \chi_{(0, t)}$ as a test function in 26, we have

$$
\begin{align*}
\int_{\Omega} B_{k}^{\varepsilon}\left(u^{\varepsilon}\right)(t) d x & +\int_{0}^{t} \int_{\Omega} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla T_{k}\left(u^{\varepsilon}\right)+\int_{0}^{t} \int_{\Omega} \gamma\left(u^{\varepsilon}\right) T_{k}\left(u^{\varepsilon}\right) d x d s  \tag{29}\\
= & \int_{0}^{t} \int_{\Omega} f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) T_{k}\left(u^{\varepsilon}\right) d x d s+\int_{\Omega} B_{k}^{\varepsilon}\left(u_{0}^{\varepsilon}\right) d x
\end{align*}
$$

for almost every $t$ in $(0, T)$, and where

$$
B_{k}^{\varepsilon}(r)=\int_{0}^{r} T_{k}(s) \frac{\partial b_{\varepsilon}(s)}{\partial s} d s
$$

Under the definition of $B_{k}^{\varepsilon}(r)$ the inequality

$$
0 \leq \int_{\Omega} B_{k}^{\varepsilon}\left(u_{0}^{\varepsilon}\right)(t) d x \leq \leq k\left|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right| d x, \quad k>0
$$

Using (8), $f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) T_{k}\left(u^{\varepsilon}\right) \geq 0$, and we have $\gamma\left(u^{\varepsilon}\right)=\lambda\left|u^{\varepsilon}\right|^{p(x)-1} u^{\varepsilon} \geq 0$ because $1<p^{-} \leq p(x) \leq+\infty$ and the definition of $B_{k}^{\varepsilon}(r)$ in 29, we obtain

$$
\begin{equation*}
\int_{\Omega} B_{k}^{\varepsilon}\left(u^{\varepsilon}\right)(t) d x+\alpha \int_{E_{k}}\left|\nabla u^{\varepsilon}\right|^{p(x)} d x d s \leq k\left\|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right\|_{L^{1}(Q)} \tag{30}
\end{equation*}
$$

where $E_{k}=\left\{(x, t) \in Q:\left|u^{\varepsilon}\right| \leq k\right\}$, using $B_{k}^{\varepsilon}\left(u^{\varepsilon}\right)(t) \geq 0$ and inequality (4) in (30), we get

$$
\alpha \int_{0}^{T} \min \left\{\left\|\nabla T_{k}\left(u^{\varepsilon}\right)\right\|_{L^{p(x)}(\Omega)}^{p-},\left\|\nabla T_{k}\left(u^{\varepsilon}\right)\right\|_{L^{p(x)}(\Omega)}^{p+}\right\} \leq \alpha \int_{\left\{(x, t) \in Q:\left|u^{\varepsilon}\right| \leq k\right\}}\left|\nabla u^{\varepsilon}\right|^{p(x)} d x d t \leq C,
$$

then is $T_{k}\left(u^{\varepsilon}\right)$ is bounded in $L^{p-}(] 0, T\left[; W_{0}^{1, p(x)}(\Omega)\right)$.
In the other hand, we obtain

$$
\begin{equation*}
k \int_{\left\{(t, x) \in Q:\left|u^{\varepsilon}\right|>k\right\}}\left|\gamma\left(u^{\varepsilon}\right)\right| d x d t \leq k\left\|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right\|_{L^{1}(Q)} \tag{32}
\end{equation*}
$$

and

$$
\begin{equation*}
k \int_{\left\{(x, t) \in Q:\left|u^{\varepsilon}\right|>k\right\}}\left|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t \leq k\left\|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right\|_{L^{1}(Q)} \tag{33}
\end{equation*}
$$

Now, let $T_{1}\left(s-T_{k}(s)\right)=T_{k, 1}(s)$ and we take $T_{k, 1}\left(b_{\varepsilon}\left(u^{\varepsilon}\right)\right)$ as test function in 26. Reasoning as above, using that $\nabla T_{k, 1}(s)=$ $\nabla s \chi_{\{k \leq|s| \leq k+1\}}$ and appling young's inequality, we obtain

$$
\begin{gathered}
\alpha \int_{\left\{k \leq\left|b_{\varepsilon}\left(u^{\varepsilon}\right)\right| \leq k+1\right\}} b_{\varepsilon}^{\prime}\left(u^{\varepsilon}\right)\left|\nabla\left(u^{\varepsilon}\right)\right|^{p(x)} d x d t \leq k \int_{\left|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right|>k}\left|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right| d x+C k \int_{\left|b_{\varepsilon}\left(u^{\varepsilon}\right)\right|>k}\left|\gamma\left(u^{\varepsilon}\right)\right| d x d t \\
+C k \int_{\left|b_{\varepsilon}\left(u^{\varepsilon}\right)\right|>k}\left|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t \leq C_{1}
\end{gathered}
$$

inequality (4) implies that

$$
\begin{align*}
& \int_{0}^{T} \alpha \chi_{\left\{k \leq\left|b_{\varepsilon}\left(u^{\varepsilon}\right)\right| \leq k+1\right\}} \min \left\{\left\|\nabla\left(b_{\varepsilon}\left(u^{\varepsilon}\right)\right)\right\|_{L^{p(x)}(\Omega)}^{p-},\left\|\nabla\left(b_{\varepsilon}\left(u^{\varepsilon}\right)\right)\right\|_{L^{p(x)}(\Omega)}^{p+}\right\}  \tag{34}\\
\leq & \alpha \int_{\left\{k \leq\left|b_{\varepsilon}\left(u^{\varepsilon}\right)\right| \leq k+1\right\}} b_{\varepsilon}^{\prime}\left(u^{\varepsilon}\right)\left|\nabla\left(u^{\varepsilon}\right)\right|^{p(x)} d x d t \leq C_{1} .
\end{align*}
$$

On sait que the propriete of $B_{k}^{\varepsilon}\left(u^{\varepsilon}\right), \quad\left(B_{k}^{\varepsilon}\left(u^{\varepsilon}\right) \geq 0, B_{k}^{\varepsilon}\left(u^{\varepsilon}\right)\right) \geq \rho(|s|-1)$, we obtain

$$
\begin{align*}
\int_{\Omega}\left|B_{k}^{\varepsilon}\left(u^{\varepsilon}\right)(t)\right| d x \leq k \int_{\Omega}\left|b_{\varepsilon}\left(u^{\varepsilon}\right)(t)\right| d x & \leq \rho\left(\int_{\Omega}|1| d x+k\left\|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right\|_{L^{1}(\Omega)}\right) \\
& \leq \rho\left(\operatorname{meas}(\Omega)+k\left\|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right\|_{L^{1}(\Omega)}\right) \tag{35}
\end{align*}
$$

From the estimation (31, (34), (35) and the properites of $B_{k}^{\varepsilon}$ and $b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)$, we deduce that

$$
\begin{equation*}
b_{\varepsilon}\left(u^{\varepsilon}\right) \text { is bounded in } L^{\infty}(] 0, T\left[; L^{1}(\Omega)\right) \tag{36}
\end{equation*}
$$

and

$$
\begin{equation*}
b_{\varepsilon}\left(u^{\varepsilon}\right) \text { is bounded in } L^{p-}(] 0, T\left[; W_{0}^{1, p(x)}(\Omega)\right) \tag{37}
\end{equation*}
$$

by Lemma 2.1 in $^{[8}$ and by (34), (35) and si $2-\frac{1}{N+1}<p()<$.$N , we obtain$

$$
\begin{equation*}
b_{\varepsilon}\left(u^{\varepsilon}\right) \text { is bounded in } L^{q-}(] 0, T\left[; W_{0}^{1, q(x)}(\Omega)\right), \tag{38}
\end{equation*}
$$

for all continuous variable exponents $q \in C(\bar{\Omega})$ satisfying $1 \leq q(x)<\frac{N(p(x)-1)+p(x)}{N+1}$, for all $x \in \Omega$.
And

$$
\begin{equation*}
T_{k}\left(u^{\varepsilon}\right) \text { is bounded in } L^{p^{-}}(] 0, T\left[; W_{0}^{1, p(.)}(\Omega)\right) \tag{39}
\end{equation*}
$$

By (32) and (33), we may conclude that

$$
\begin{equation*}
\gamma\left(u^{\varepsilon}\right) \text { is bounded in } L^{1}(] 0, T\left[; L^{1}(\Omega)\right), \tag{40}
\end{equation*}
$$

and

$$
\begin{equation*}
f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) \text { is bounded in } L^{1}(] 0, T\left[; L^{1}(\Omega)\right), \tag{41}
\end{equation*}
$$

independently of $\varepsilon$.
Proceeding as in ${ }^{4}, \sqrt{[5]}$ that for any $S \in W^{2, \infty}(\mathbb{R})$ such that $S^{\prime}$ is compact (supp $\left.S^{\prime} \subset[-k, k]\right)$

$$
\begin{equation*}
S\left(u^{\varepsilon}\right) \text { is bounded in } L^{p-}(] 0, T\left[; W_{0}^{1, p(.)}(\Omega)\right) \tag{42}
\end{equation*}
$$

and

$$
\begin{equation*}
\left(S\left(u^{\varepsilon}\right)\right)_{t} \text { is bounded in } L^{1}(Q)+L^{(p-)^{\prime}}(] 0, T\left[; W^{-1, p^{\prime}(.)}(\Omega)\right) \tag{43}
\end{equation*}
$$

In fact, as a consequence of (39), by Stampacchia's Theorem, we obtain (42). To show that (43) holds true, we multiply the equation 26 by $S^{\prime}\left(u^{\varepsilon}\right)$ to obtain

$$
\begin{gather*}
\left(B_{S}\left(u^{\varepsilon}\right)\right)_{t}=\operatorname{div}\left(S^{\prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right)\right)-\mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla\left(S^{\prime}\left(u^{\varepsilon}\right)\right)  \tag{44}\\
-\gamma\left(u^{\varepsilon}\right) S^{\prime}\left(u^{\varepsilon}\right)+f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) S^{\prime}\left(u^{\varepsilon}\right) \text { in } \mathcal{D}^{\prime}(Q) .
\end{gather*}
$$

Since $\operatorname{supp}\left(S^{\prime}\right)$ and $\operatorname{supp}\left(S^{\prime \prime}\right)$ are both included in $[-k ; k] ; u^{\varepsilon}$ may be replaced by $T_{k}\left(u^{\varepsilon}\right)$ in $\left\{\left|u^{\varepsilon}\right| \leq k\right\}$. On the other hand we have

$$
\begin{gather*}
\left|S^{\prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right)\right|  \tag{45}\\
\leq \beta\left\|S^{\prime}\right\|_{L^{\infty}}\left[L(x, t)+\left|\nabla T_{k}\left(u^{\varepsilon}\right)\right|^{p(x)-1}\right] .
\end{gather*}
$$

As a consequence, each term in the right hand side of (44) is bounded either in $L^{(p-)^{\prime}}\left(10, T\left[; W^{-1, p^{\prime}(.)}(\Omega)\right)\right.$ or in $L^{1}(Q)$, and we then obtain (43).
Now we look for an estimate on a sort of energy at infinity of the approximating solutions. For any integer $n \geq 1$, consider the Lipschitz continuous function $\theta_{n}$ defined through

$$
\theta_{n}(s)=T_{n+1}(s)-T_{n}(s)=\left\{\begin{array}{cl}
0 & \text { if }|s| \leq n \\
(|s|-n) \operatorname{sign}(s) & \text { if } n \leq|s| \leq n+1 \\
\operatorname{sign}(s) & \text { if }|s| \geq n
\end{array}\right.
$$

Remark that $\left\|\theta_{n}\right\|_{L^{\infty}} \leq 1$ for any $n \geq 1$ and that $\theta_{n}(s) \rightarrow 0$, for any $s$ when $n$ tends to infinity. Using the admissible test function $\theta_{n}\left(u^{\varepsilon}\right)$ in (26) leads to

$$
\begin{align*}
\int_{\Omega} \tilde{\theta}_{n}\left(u^{\varepsilon}\right)(t) d x & +\int_{Q} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla\left(\theta_{n}\left(u^{\varepsilon}\right)\right) d x d t+\int_{Q} \gamma\left(u^{\varepsilon}\right) \theta_{n}\left(u^{\varepsilon}\right) d x d t \\
& =\int_{Q} f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) \theta_{n}\left(u^{\varepsilon}\right) d x d t+\int_{\Omega} \tilde{\theta}_{n}\left(u_{0}^{\varepsilon}\right) d x \tag{46}
\end{align*}
$$

where $\tilde{\theta}_{n}(r)(t)=\int_{0}^{r} \theta_{n}(s) \frac{\partial b_{\varepsilon}(s)}{\partial s} d s$,
for almost any $t$ in $] 0, T\left[\right.$ and where $\tilde{\theta}_{n}(r)=\int_{0}^{r} \theta_{n}(s) d s \geq 0$. Hence, dropping a nonnegative term

$$
\begin{align*}
& \quad \int_{\left\{n \leq\left|u^{\varepsilon}\right| \leq n+1\right\}} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla u^{\varepsilon} d x d t  \tag{47}\\
& \leq \int_{Q} \gamma\left(u^{\varepsilon}\right) \theta_{n}\left(u^{\varepsilon}\right) d x d t+\int_{Q} f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) \theta_{n}\left(u^{\varepsilon}\right) d x d t+\int_{\Omega} \widetilde{\theta}_{n}\left(u_{0}^{\varepsilon}\right) d x \\
& \leq \int_{\left\{\left|u^{\varepsilon}\right| \geq n\right\}}\left|\gamma\left(u^{\varepsilon}\right)\right| d x d t+\int_{\left\{\left|u^{\varepsilon}\right| \geq n\right\}}\left|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t+\int_{\left\{\left|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right| \geq n\right\}}\left|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right| d x .
\end{align*}
$$

- Step 2: The limit of the solution of the approximated problem.

Arguing again as in $[4,5,6]$ estimates (42) and (43) imply that, for a subsequence still indexed by $\varepsilon$,

$$
\begin{equation*}
u^{\varepsilon} \text { converge almost every where to } u \text { in } Q \tag{48}
\end{equation*}
$$

using (26), (39) and (45), we get

$$
\begin{gather*}
T_{k}\left(u^{\varepsilon}\right) \text { converge weakly to } T_{k}(u) \text { in } L^{p-}(] 0, T\left[, W_{0}^{1, p(.)}(\Omega)\right),  \tag{49}\\
\chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \rightharpoonup \eta_{k} \text { weakly in }\left(L^{p^{\prime}(.)}(Q)\right)^{N} \tag{50}
\end{gather*}
$$

as $\varepsilon$ tends to 0 for any $k>0$ and any $n \geq 1$ and where for any $k>0, \eta_{k}$ belongs to $\left(L^{p^{\prime}(.)}(Q)\right)^{N}$. Since $\gamma\left(u^{\varepsilon}\right)$ is a continuous incrassing function, from the monotone convergence theorem and (32) and by (48), we obtain that

$$
\begin{equation*}
\gamma\left(u^{\varepsilon}\right) \text { converge weakly to } \gamma(u) \text { in } L^{1}(Q) . \tag{51}
\end{equation*}
$$

We now establish that $b(u)$ belongs to $L^{\infty}(] 0, T\left[; L^{1}(\Omega)\right)$. Indeed using (29) and $\left|B_{k}^{\varepsilon}(s)\right| \geq|s|-1$ leads to

$$
\int_{\Omega}\left|b_{\varepsilon}\left(u^{\varepsilon}\right)\right|(t) d x \leq \operatorname{meas}(\Omega)+k\left\|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right\|_{L^{1}(Q)}+k\left\|\gamma\left(u^{\varepsilon}\right)\right\|_{L^{1}(Q)}+k\left\|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right\|_{L^{1}(\Omega)}
$$

Using (32) and (22), (33), we have $u$ belongs to $L^{\infty}(] 0, T\left[; L^{1}(\Omega)\right)$. We are now in a position to exploit 47). Since $u^{\varepsilon}$ is bounded in $L^{\infty}(] 0, T\left[; L^{1}(\Omega)\right)$, we get

$$
\begin{equation*}
\lim _{n \rightarrow+\infty}\left(\sup _{\varepsilon} \text { eas }\left\{\left|u^{\varepsilon}\right| \geq n\right\}\right)=0 \tag{52}
\end{equation*}
$$

The equi-integrability of the sequence $f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)$ in $L^{1}(Q)$. We shall now prove that $f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)$ converges to $f(x, t, u)$ strongly in $L^{1}(Q)$, by using VitaliâĂŹs theorem. Since $f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) \rightarrow f(x, t, u)$ a.e in $Q$ it suffices to prove that $f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)$ are equi-integrable in $Q$. Let $\delta>0$ and $\mathbf{A}$ be a measurable subset belonging to $\Omega \times] 0, T$, we define the following sets

$$
\begin{align*}
& G_{\delta}=\{(x, t) \in Q:  \tag{53}\\
& F_{\delta}=\{(x, t) \in Q:  \tag{54}\\
&\left.\left|u_{n}\right| \leq \delta\right\} \\
&\left.\left|u_{n}\right|>\delta\right\}
\end{align*}
$$

Using the generalized Hölder's inequality and Poincaré inequality, we have

$$
\int_{\mathbf{A}}\left|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t=\int_{\mathbf{A} \cap G_{\delta}}\left|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t+\int_{\mathbf{A} \cap F_{\delta}}\left|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t
$$

therfore

$$
\begin{aligned}
& \int_{\mathbf{A}}\left|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t \leq \int_{\mathbf{A} \cap G_{\delta}}\left(c_{\varepsilon}(x, t)+\sigma_{\varepsilon}\left|u_{n}\right|^{p(x)-1}\right) d x d t+\int_{\mathbf{A} \cap F_{\delta}}\left|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t \\
& \leq \int_{\mathbf{A}} c_{\varepsilon}(x, t) d x d t+\sigma_{\varepsilon} \int_{Q}\left|\nabla T_{\delta}\left(u^{\varepsilon}\right)\right|^{p(x)-1} d x d t \\
& +\int_{\mathbf{A} \cap F_{\delta}}\left|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t \\
& \leq \int_{\mathbf{A}} c_{\varepsilon}(x, t) d x d t+\sigma_{\varepsilon}\left(\frac{1}{p^{-}}+\frac{1}{p^{\prime-}}\right)(\operatorname{meas}(\mathbf{Q})+1)^{\frac{1}{p^{-}}} \\
& \left(\int_{Q_{T}}\left|\nabla T_{\delta}\left(u^{\varepsilon}\right)\right|^{(p(x)-1) p^{\prime}(x)} d x d t\right)^{\frac{1}{p^{\prime-}}}+\int_{\mathbf{A} \cap F_{\delta}}\left|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t \\
& \leq K_{1}+C_{2}\left(\frac{k}{\alpha}\left\|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right\|_{L^{1}(\Omega)}\right)^{\frac{1}{2}}+\int_{\mathbf{A} \cap F_{\delta}} \frac{1}{\left|u^{\varepsilon}\right|}\left|u^{\varepsilon} f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t \\
& \leq K_{2}+\int_{\mathbf{A} \cap F_{\delta}} \frac{1}{\delta}\left|u^{\varepsilon} f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right| d x d t \\
& \leq K_{2}+\frac{1}{\delta}\left(\frac{1}{p^{-}}+\frac{1}{p^{-}}\right)\left(\int_{A \cap F_{\delta}}\left|u^{\varepsilon}\right|^{p(x)} d x d t\right)^{\frac{1}{p^{-}}} \\
& \left(\int_{A \cap F_{\delta}}\left|f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)\right|^{p^{\prime}(x)(p(x)-1)} d x d t\right)^{\frac{1}{p^{\prime}}} \\
& \rightarrow 0 \text { when meas }(\mathbf{A}) \rightarrow \mathbf{0} \text {. }
\end{aligned}
$$

Which shows that $f^{\varepsilon}\left(x, t, u^{\varepsilon}\right)$ is equi-integrable. By using Vitali's theorem, we get

$$
\begin{equation*}
f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) \rightarrow f(x, t, u) \text { strongly in } L^{1}(Q) \tag{55}
\end{equation*}
$$

Using (51), (55) and the equi-integrability of the sequence $\left|b_{\varepsilon}\left(u_{0}^{\varepsilon}\right)\right|$ in $L^{1}(\Omega)$, we deduce that

$$
\begin{equation*}
\lim _{n \rightarrow+\infty}\left(\sup _{\varepsilon} \int_{\left\{n \leq\left|u^{\varepsilon}\right| \leq n+1\right\}} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla u^{\varepsilon} d x d t\right)=0 \tag{56}
\end{equation*}
$$

## - Step 4: Strong convergence.

The specifie time regularization of $T_{k}(u)$ (for fixed $k \geq 0$ ) is defined as follows. Let $\left(v_{0}^{\mu}\right)_{\mu}$ be a sequaence in $L^{\infty}(\Omega) \cap$ $W_{0}^{1, p(.)}(\Omega)$ such that $\left\|v_{0}^{\mu}\right\|_{L^{\infty}(\Omega)} \leq k, \quad \forall \mu>0$, and $v_{0}^{\mu} \rightarrow T_{k}\left(u_{0}\right)$ a.e in $\Omega$ with $\frac{1}{\mu}\left\|v_{0}^{\mu}\right\|_{L^{p(.)}(\Omega)} \rightarrow 0$ as $\mu \rightarrow+\infty$.
For fixed $k \geq 0$ and $\mu>0$, let us consider the unique solution $T_{k}(u)_{\mu} \in L^{\infty}(\Omega) \cap L^{p-}(] 0, T\left[; W_{0}^{1, p(.)}(\Omega)\right)$ of the monotone problem

$$
\begin{gather*}
\frac{\partial T_{k}(u)_{\mu}}{\partial t}+\mu\left(T_{k}(u)_{\mu}-T_{k}(u)\right)=0 \text { in } \mathcal{D}^{\prime}(Q)  \tag{57}\\
T_{k}(u)_{\mu}(t=0)=v_{0}^{\mu} \tag{58}
\end{gather*}
$$

The behavior of $T_{k}(u)_{\mu}$ as $\mu \rightarrow+\infty$ is investigated in ${ }^{9}$ and we just recall here that (57)-(58) imply that

$$
\begin{equation*}
T_{k}(u)_{\mu} \rightarrow T_{k}(u) \text { strongly in } L^{p-}(] 0, T\left[; W_{0}^{1, p(.)}(\Omega)\right) \text { a.e in } Q \text { as } \mu \rightarrow+\infty \tag{59}
\end{equation*}
$$

with $\left\|T_{k}(u)_{\mu}\right\|_{L^{\infty}(\Omega)} \leq k$, for any $\mu$, and $\frac{\partial T_{k}(u)_{\mu}}{\partial t} \in L^{(p-)^{\prime}}(] 0, T\left[; W^{-1, p^{\prime}(.)}(\Omega)\right)$.

The main estimate is the following
Lemma 1. Let $S$ be an increasing $C^{\infty}(\mathbb{R})$ - function such that $S(r)=r$ for $r \leq k$, and supp $S^{\prime}$ is compact. Then

$$
\liminf _{\mu \rightarrow+\infty} \lim _{\varepsilon \rightarrow 0} \int_{0}^{T}\left\langle\frac{\partial u^{\varepsilon}}{\partial t}, S^{\prime}\left(u^{\varepsilon}\right)\left(T_{k}\left(u^{\varepsilon}\right)_{\mu}-T_{k}(u)\right)\right\rangle d t \geq 0
$$

where here $\langle.,$.$\rangle denotes the duality pairing between L^{1}(\Omega)+W^{-1, p^{\prime}(.)}(\Omega)$ and $L^{\infty}(\Omega) \cap W_{0}^{1, p(.)}(\Omega)$.
Proof. See ${ }^{6}$, Lemma 1.

- Step 4: Here we are to prove that the weak limit $\eta_{k}$ and we prove the weak $L^{1}$ convergence of the "truncted" energy $\mathcal{A}\left(x, t, \nabla T_{k}\left(u^{\varepsilon}\right)\right)$ as $\varepsilon$ tends to 0 . In order to show this result we recall the lemma below.
Lemma 2. The subsequence of $u^{\varepsilon}$ defined in step 3 satisfies

$$
\begin{align*}
& \limsup _{\varepsilon \rightarrow 0} \int_{Q} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla T_{k}\left(u^{\varepsilon}\right) d x d t \leq \int_{Q} \eta_{k} \nabla T_{k}(u) d x d t  \tag{60}\\
& \lim _{\varepsilon \rightarrow 0} \int_{Q}\left[\mathcal{A}\left(x, t, \nabla u_{\chi_{\left\{\left|\left|u^{\varepsilon}\right| \leq k\right\}\right.}^{\varepsilon}}\right)-\mathcal{A}\left(x, t, \nabla u_{\left.\chi_{||| | \leq K k}\right]}\right)\right] \\
&  \tag{61}\\
& \times\left[\nabla u_{\chi_{\{|u| \leq K\}}^{\varepsilon}}^{\varepsilon}-\nabla u_{\left.\chi_{\{|u| \leq k\}}\right]}\right] d x d t=0
\end{align*}
$$

$\eta_{k}=\mathcal{A}\left(x, t, \nabla u_{\chi_{||| | \leq k]}}\right)$ a.e in $Q$, for any $k \geq 0$, as $\varepsilon$ tends to 0 .

$$
\begin{equation*}
\mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla T_{k}\left(u^{\varepsilon}\right) \rightarrow \mathcal{A}(x, t, \nabla u) \nabla T_{k}(u) \text { weakly in } L^{1}(Q) \tag{62}
\end{equation*}
$$

Proof. Let us introduce a sequence of increasing $C^{\infty}(\mathbb{R})$-functions $S_{n}$ such that, for any $n \geq 1$

$$
\left\{\begin{array}{c}
S_{n}(r)=r \text { if }|\mathrm{r}| \leq n  \tag{63}\\
\operatorname{supp}\left(S_{n}^{\prime}\right) \subset[-(n+1),(n+1)] \\
\left\|S_{n}^{\prime \prime}\right\|_{L^{\infty}(\mathbb{R})} \leq 1
\end{array}\right.
$$

For fixed $k \geq 0$, we consider the test function $S_{n}^{\prime}\left(u^{\varepsilon}\right)\left(T_{k}\left(u_{\varepsilon}\right)-\left(T_{k}(u)\right)_{\mu}\right)$ in (26), we use the definition 63) of $S_{n}^{\prime}$ and we definie $W_{\mu}^{\varepsilon}=T_{k}\left(u_{\varepsilon}\right)-\left(T_{k}(u)\right)_{\mu}$, we get

$$
\begin{align*}
& \int_{0}^{T}\left\langle\left(u^{\varepsilon}\right)_{t}, S_{n}^{\prime}\left(u^{\varepsilon}\right) W_{\mu}^{\varepsilon}\right\rangle d t+\int_{Q} S_{n}^{\prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla W_{\mu}^{\varepsilon} d x d t  \tag{64}\\
& +\int_{Q} S_{n}^{\prime \prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla u^{\varepsilon} W_{\mu}^{\varepsilon} d x d t+\int_{Q} \gamma\left(u^{\varepsilon}\right) S_{n}^{\prime}\left(v^{\varepsilon}\right) W_{\mu}^{\varepsilon} d x d t \\
= & \int_{Q} f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) S_{n}^{\prime}\left(u^{\varepsilon}\right) W_{\mu}^{\varepsilon} d x d t .
\end{align*}
$$

Now we pass to the limit in (64) as $\varepsilon \rightarrow 0, \mu \rightarrow+\infty, n \rightarrow+\infty$ for $k$ real number fixed. In order to perform this task, we prove below the following results for any $k \geq 0$ :

$$
\begin{align*}
& \liminf _{\mu \rightarrow+\infty} \lim _{\varepsilon \rightarrow 0} \int_{0}^{T}\left\langle\left(u^{\varepsilon}\right)_{t}, S_{n}^{\prime}\left(u^{\varepsilon}\right) W_{\mu}^{\varepsilon}\right\rangle d t \geq 0 \text { for any } n \geq k,  \tag{65}\\
& \lim _{n \rightarrow+\infty} \lim _{\mu \rightarrow+\infty} \lim _{\varepsilon \rightarrow 0} \int_{Q} S_{n}^{\prime \prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla u^{\varepsilon} W_{\mu}^{\varepsilon} d x d t=0 \tag{66}
\end{align*}
$$

$$
\begin{gather*}
\lim _{\mu \rightarrow+\infty \varepsilon \rightarrow 0} \lim _{Q} \gamma\left(u^{\varepsilon}\right) S_{n}^{\prime}\left(u^{\varepsilon}\right) W_{\mu}^{\varepsilon} d x d t=0, \text { for any } n \geq 1  \tag{67}\\
\lim _{\mu \rightarrow+\infty} \lim _{\varepsilon \rightarrow 0} \int_{Q} f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) S_{n}^{\prime}\left(u^{\varepsilon}\right) W_{\mu}^{\varepsilon} d x d t=0, \text { for any } n \geq 1 \tag{68}
\end{gather*}
$$

Proof of (65). In view of the definition $W_{\mu}^{\varepsilon}$, we apply lemma (1) with $S=S_{n}$ for fixed $n \geq k$. As a consequence, 65) hold true.

Proof of (66). For any $n \geq 1$ fixed, we have $\operatorname{supp}\left(S_{n}^{\prime \prime}\right) \subset[-(n+1),-n] \cup[n, n+1],\left\|W_{\mu}^{\varepsilon}\right\|_{L^{\infty}(Q)} \leq 2 k$ and $\left\|S_{n}^{\prime \prime}\right\|_{L^{\infty}(\mathbb{R})} \leq 1$, we get

$$
\begin{align*}
& \left|\int_{Q} S_{n}^{\prime \prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla u^{\varepsilon} W_{\mu}^{\varepsilon} d x d t\right|  \tag{69}\\
\leq & 2 k \int_{\left\{n \leq\left|u^{\varepsilon}\right| \leq n+1\right\}} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla u^{\varepsilon} d x d t
\end{align*}
$$

for any $n \geq 1$, by (56) it possible to etablish 66)
Proof of (67). For fixed $n \geq 1$ and in view (51). Lebesgue's convergence theorem implies that for any $\mu>0$ and any $n \geq 1$

$$
\begin{equation*}
\lim _{\varepsilon \rightarrow 0} \int_{Q} \gamma\left(u^{\varepsilon}\right) S_{n}^{\prime}\left(u^{\varepsilon}\right) W_{\mu}^{\varepsilon} d x d t=\int_{Q} \gamma(u) S_{n}^{\prime}(u)\left(T_{k}(u)-T_{k}(u)_{\mu}\right) d x d t \tag{70}
\end{equation*}
$$

Appealing now to (59) and passing to the limit as $\mu \rightarrow+\infty$ in (70) allows to conclude that (67) holds true.
Proof of (68). By (23), (55) and Lebesgue's convergence theorem implies that for any $\mu>0$ and any $n \geq 1$, it is possible to pass to the limit for $\varepsilon \rightarrow 0$

$$
\lim _{\varepsilon \rightarrow 0} \int_{Q} f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) S_{n}^{\prime}\left(u^{\varepsilon}\right) W_{\mu}^{\varepsilon} d x d t=\int_{Q} f(x, t, u) S_{n}^{\prime}(u)\left(T_{k}(u)-T_{k}(u)_{\mu}\right) d x d t
$$

using (59) permits to the limit as $\mu$ tends to $+\infty$ in the above equality to obtain 68).
We now turn back to the proof of Lemma (2), due to (65)-68), we are in a position to pass to the limit-sup when $\varepsilon \rightarrow 0$, then to the limit-sup when $\mu \rightarrow+\infty$ and then to the limit as $n \rightarrow+\infty$ in . U4). Using the definition of $W_{\mu}^{\varepsilon}$, we deduce that for any $k \geq 0$,

$$
\lim _{n \rightarrow+\infty} \operatorname{limsuplimsup}_{\mu \rightarrow+\infty} \int_{\varepsilon \rightarrow 0} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) S_{n}^{\prime}\left(u^{\varepsilon}\right) \nabla\left(T_{k}\left(u^{\varepsilon}\right)-T_{k}(u)_{\mu}\right) d x d t \leq 0 .
$$

Since $\mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) S_{n}^{\prime}\left(u^{\varepsilon}\right) \nabla T_{k}\left(u^{\varepsilon}\right)=\mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla T_{k}\left(u^{\varepsilon}\right)$ fo $k \leq n$, the above inequality implies that for $k \leq n$,

$$
\begin{align*}
& \limsup _{\varepsilon \rightarrow 0} \int_{Q} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla T_{k}\left(u^{\varepsilon}\right) d x d t  \tag{71}\\
\leq & \lim _{n \rightarrow+\infty} \operatorname{limsuplimsup}_{\mu \rightarrow+\infty} \int_{\varepsilon \rightarrow 0} \mathcal{A}\left(t, x, \nabla u^{\varepsilon}\right) S_{n}^{\prime}\left(u^{\varepsilon}\right) \nabla T_{k}(u)_{\mu} d x d t .
\end{align*}
$$

Due to (50), we have

$$
\mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) S_{n}^{\prime}\left(u^{\varepsilon}\right) \rightarrow \eta_{n+1} S_{n}^{\prime}(u) \text { weakly in }\left(L^{p^{\prime}(.)}(Q)\right)^{N} \text { as } \varepsilon \rightarrow 0
$$

and the strong convergence of $T_{k}(u)_{\mu}$ to $T_{k}(u)$ in $L^{p^{-}}(] 0, T\left[; W_{0}^{1, p}(\Omega)\right)$ as $\mu \rightarrow+\infty$, we get

$$
\begin{align*}
& \lim _{\mu \rightarrow+\infty \varepsilon \rightarrow 0} \lim _{Q} \int_{\mathcal{A}}\left(x, t, \nabla u^{\varepsilon}\right) S_{n}^{\prime}\left(u^{\varepsilon}\right) \nabla T_{k}(u)_{\mu} d x d t  \tag{72}\\
= & \int_{Q} S_{n}^{\prime}(u) \eta_{n+1} \nabla T_{k}(u) d x d t=\int_{Q} \eta_{n+1} \nabla T_{k}(u) d x d t,
\end{align*}
$$

as soon as $k \leq n$, since $S_{n}^{\prime}(s)=1$ for $|s| \leq n$. Now, for $k \leq n$, we have

$$
S_{n}^{\prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right)_{\chi_{\left|\left|u^{\varepsilon}\right| \leq k\right\}}}=\mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right)_{\chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}}} \text {.e in } Q .
$$

Letting $\varepsilon \rightarrow 0$, we obtain

$$
\eta_{n+1} \chi_{\{|u| \leq k\}}=\eta_{k} \chi_{\{|u| \leq k\}} \text { a.e in } Q-\{|u|=k\} \text { for } k \leq n .
$$

Recalling (71) and (72) allows to conclude that (60) holds true.
Proof of (61). Let $k \geq 0$ be fixed. We use the monotone character (10) of $\mathcal{A}(x, t, \xi)$ with respest to $\xi$, we obtain

$$
\begin{equation*}
I^{\varepsilon}=\int_{Q}\left(\mathcal{A}\left(x, t, \nabla u^{\varepsilon} \chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}}\right)-\mathcal{A}\left(x, t, \nabla u \chi_{\{|u| \leq k\}}\right)\right)\left(\nabla u^{\varepsilon} \chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}}-\nabla u \chi_{\{|u| \leq k\}}\right) d x d t \geq 0 \tag{73}
\end{equation*}
$$

Inequality 73 is split into $I^{\varepsilon}=I_{1}^{\varepsilon}+I_{2}^{\varepsilon}+I_{3}^{\varepsilon}$ where

$$
\begin{aligned}
& I_{1}^{\varepsilon}=\int_{Q} \mathcal{A}\left(x, t, \nabla u^{\varepsilon} \chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}}\right) \nabla u^{\varepsilon} \chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}} d x d t \\
& I_{2}^{\varepsilon}=-\int_{Q} \mathcal{A}\left(x, t, \nabla u^{\varepsilon} \chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}}\right) \nabla u \chi_{\{|u| \leq k\}} d x d t \\
& I_{3}^{\varepsilon}=-\int_{Q} \mathcal{A}\left(x, t, \nabla u \chi_{\{|u| \leq k\}}\right)\left(\nabla u^{\varepsilon} \chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}}-\nabla u \chi_{\{|u| \leq k\}}\right) d x d t
\end{aligned}
$$

We pass to the limit-sup as $\varepsilon \rightarrow 0$ in $I_{1}^{\varepsilon}, I_{2}^{\varepsilon}$ and $I_{2}^{\varepsilon}$. Let us remark that we have $u^{\varepsilon}=T_{k}\left(u^{\varepsilon}\right)$ and $\nabla u^{\varepsilon} \chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}}=\nabla T_{k}\left(u^{\varepsilon}\right)$ a.e in $Q$, and we can assume that $k$ is such that $\chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}}$ almost everywhere converges to $\chi_{\{|u| \leq k\}}$ (in fact this is true for almost every $k$, see Lemma 3.2 in $^{77}$ ). Using (60), we obtain

$$
\begin{align*}
\lim _{\varepsilon \rightarrow 0} I_{1}^{\varepsilon} & =\lim _{\varepsilon \rightarrow 0} \int_{Q} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla T_{k}\left(u^{\varepsilon}\right) d x d t  \tag{74}\\
& \leq \int_{Q} \eta_{k} \nabla T_{k}(u) d x d t
\end{align*}
$$

In view of (49) and (50), we have

$$
\begin{align*}
\lim _{\varepsilon \rightarrow 0} I_{2}^{\varepsilon} & =-\lim _{\varepsilon \rightarrow 0} \int_{Q} \mathcal{A}\left(x, t, \nabla u^{\varepsilon} \chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}}\right)\left(\nabla T_{k}(u)\right) d x d t  \tag{75}\\
& =-\int_{Q} \eta_{k}\left(\nabla T_{k}(u)\right) d x d t
\end{align*}
$$

As a consequence of (49), we have for all $k>0$

$$
\begin{equation*}
\lim _{\varepsilon \rightarrow 0} I_{3}^{\varepsilon}=-\int_{Q} \mathcal{A}\left(x, t, \nabla u \chi_{\{|u| \leq k\}}\right)\left(\nabla T_{k}\left(u^{\varepsilon}\right)-\nabla T_{k}(u)\right) d x d t=0 \tag{76}
\end{equation*}
$$

Taking the limit-sup as $\varepsilon \rightarrow 0$ in (73) and using (74), (75) and (76) show that (61) holds true.
Proof of (62). Using (61) and the usual Minty argument applies it follows that (62) holds true.

- Step 5: In this step we prove that $u$ satisfies $(17),(18)$ and $\sqrt{19}$. For any fixed $n \leq 0$ one has

$$
\begin{aligned}
& \int_{\left\{n \leq\left|u^{\varepsilon}\right| \leq n+1\right\}} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla u^{\varepsilon} d x d t \\
= & \int_{Q} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla T_{n+1}\left(u^{\varepsilon}\right) d x d t-\int_{Q} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla T_{n}\left(u^{\varepsilon}\right) d x d t .
\end{aligned}
$$

According to 50 and 50 one is at liberty to pass to the limit as $\varepsilon$ tends to 0 for fixed $n \geq 1$ and to obtain

$$
\begin{align*}
& \lim _{\varepsilon \rightarrow 0} \int_{\left\{n \leq\left|u^{\varepsilon}\right| \leq n+1\right\}} \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla u^{\varepsilon} d x d t  \tag{77}\\
= & \int_{Q} \mathcal{A}(x, t, \nabla u) \nabla T_{n+1}(u) d x d t-\int_{Q} \mathcal{A}(x, t, \nabla u) \nabla T_{n}(u) d x d t \\
= & \int_{\left\{n \leq\left|u^{\varepsilon}\right| \leq n+1\right\}} \mathcal{A}(x, t, \nabla u) \nabla u d x d t .
\end{align*}
$$

Taking that limit as $n$ tends to $+\infty$ in (77) and using the estimate (56, that $u$ satisfies (17).
Let $S$ be a function in $W^{2, \infty}(\mathbb{R})$ such that $S^{\prime}$ has a compact. Let $k$ be a positive real number such that $\operatorname{supp}\left(S^{\prime}\right) \subset[-k, k]$. Pontwise multiplication of that approximate equation by $S^{\prime}\left(u^{\varepsilon}\right)$ leads to

$$
\begin{align*}
& \left(B_{S}\left(u^{\varepsilon}\right)\right)_{t}-\operatorname{div}\left(S^{\prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right)\right)  \tag{78}\\
& +S^{\prime \prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla\left(u^{\varepsilon}\right)+\gamma\left(u^{\varepsilon}\right) S^{\prime}\left(u^{\varepsilon}\right)=f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) S^{\prime}\left(u^{\varepsilon}\right) \text { in } \mathcal{D}^{\prime}(Q)
\end{align*}
$$

In what follows we pass to the limit as $\varepsilon$ tends to 0 in each term of 78 . Since $S$ is bounded, and $S\left(u^{\varepsilon}\right)$ converges to $S(u)$ a.e in $Q$ and in $L^{\infty}(Q) *$-weak, then $\left(S\left(u^{\varepsilon}\right)\right)_{t}$ converges to $\left(S\left(u^{\varepsilon}\right)\right)_{t}$ in $\mathcal{D}^{\prime}(Q)$ as $\varepsilon$ tends to 0 . Since $\operatorname{supp}\left(S^{\prime}\right) \subset[-k, k]$, we have $S^{\prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(t, x, \nabla u^{\varepsilon}\right)=S^{\prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \chi_{\left\{\left|u^{\varepsilon}\right| \leq k\right\}}$ a.e in $Q$. The pointwise convergence of $u^{\varepsilon}$ to $u$ as $\varepsilon$ tends to 0 , the bounded character of $S$ and (62) of Lemma(2) imply that $S^{\prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right)$ converges to $S^{\prime}(u) \mathcal{A}(x, t, \nabla u)$ weakly in $\left(L^{p^{\prime}(.)}(Q)\right)^{N}$ as $\varepsilon$ tends to 0 , because $S^{\prime}(u)=0$ for $|u| \geq k$ a.e in $Q$. The pointwise convergence of $u^{\varepsilon}$ to $u$, the bounded character of $S^{\prime}, \quad S^{\prime \prime}$ and (62) of Lemma (2) allow to conclude that

$$
S^{\prime \prime}\left(u^{\varepsilon}\right) \mathcal{A}\left(x, t, \nabla u^{\varepsilon}\right) \nabla T_{k}\left(u^{\varepsilon}\right) \rightarrow S^{\prime \prime}(u) \mathcal{A}(x, t, \nabla u) \nabla T_{k}(u) \text { weakly in } L^{1}(Q)
$$

as $\varepsilon \rightarrow 0$. We use (51) we obtain that $\gamma\left(u^{\varepsilon}\right) S^{\prime}\left(u^{\varepsilon}\right)$ converges to $\gamma(u) S^{\prime}(u)$ in $L^{1}(Q)$, and we use 23, (49) and we obtain that $f^{\varepsilon}\left(x, t, u^{\varepsilon}\right) S^{\prime}\left(u^{\varepsilon}\right)$ converges to $f(x, t, u) S^{\prime}(u)$ in $L^{1}(Q)$. As a consequence of the above convergence result, we are in a position to pass to the limit as $\varepsilon$ tends to 0 in equation (78) and to conclude that $u$ satisfies 18 . It remains to show that $S(u)$ satisfies the initial condition 19$)$. To this end, firstly remark that, $S$ being bounded, $S\left(u^{\varepsilon}\right)$ is bounded in $L^{\infty}(Q), B_{S}\left(u^{\varepsilon}\right)$ is bounded in $L^{\infty}(Q)$. Secondly, $[78$ and the above considerations on the behavior of the terms of this equation show that $\frac{\partial B_{S}\left(u^{\varepsilon}\right)}{\partial t}$ is bounded in $L^{1}(Q)+L^{(p-)^{\prime}}(] 0, T\left[; W^{-1, p^{\prime}(.)}(\Omega)\right)$. As a consequence, an Aubin's type lemma $\left(\frac{18}{18}\right.$, Corollary 4) implies that $B_{S}\left(u^{\varepsilon}\right)$ lies in a compact set of $C(] 0, T\left[; L^{1}(\Omega)\right)$. It follows that, on the one hand, $B_{S}\left(u^{\varepsilon}\right)(t=0)$ converges to $B_{S}(u)(t=0)$ strongly in $L^{1}(\Omega)$ Due to 22 , we conclude that $(19)$ holds true. As a conclusion of Step 3 and Step 5, the proof of Theorem (1) is complete.
