1 Research in genetics provides the basis for understanding the function and evolution of all living things.  
2 The disciplines of reading and writing genomes translate into sustainable economic development with the  
3 rational global goals of food security, maternal and child health, precision medicine, education and access  
4 to informatics technologies. We believe that many publications in our field are motivated by these goals  
5 and contain reusable modular elements that can be recombined both in research and in its translation, to  
6 attain them. Open research entails sharing not only the conclusions of science, but its materials, provenance  
7 and gestation for the widest reuse by human and computational users. This means that we and our readers  
8 deplore any hiding or obscuring datasets or methods, and regret datasets in formally public repositories that  
9 have very slow accession or transfer rates. However, we will endeavor to work with all data producers who  
10 make contributions in good faith to genetics and genomics research.

11 *Genetics & Genomics Next (GGN)* is an Open Research journal from Wiley, published online using the  
12 CC-BY 4.0 open attribution license to encourage maximum credit and rapid creative reuse of all scholarly  
13 work. We are delighted to receive original research Articles, Resources, Analysis, Technical Reports and  
14 Perspectives in the areas of human, animal, plant and microbial genetics, genomics and epigenomics, selecting  
15 those reports for peer review that we judge editorially to have the highest research utility, ethical standards  
16 and societal impact. As professional, full-time editors at Wiley, we take responsibility for all manuscript  
17 decisions and peer reviewer assignment. Our Advisory Board Members have a complementary role to guide  
18 *GGN's* mission as they see fit, anticipating the evolution of research and standards in our field, and, with  
19 us, providing leadership in promoting excellence in open research. Unlike Editorial Board members at some  
20 journals, *GGN* advisors are our mentors, not manuscript editors. We welcome their commitment to the  
21 journal for as long as they wish, and advisors may leave or rejoin the board at will.

22 Since we offer an online journal, we are happy to consider reports in any format for peer review, pro-  
23 vided they would not burden referees with their unusual length or complexity. We also welcome pre-  
24 submission enquiries via our online database (<https://mc.manuscriptcentral.com/ggn>). Author and  
25 dataset contributions and consortium roles can be described via the CRediT contributor taxonomy (<https://www.casrai.org/credit.html>). We support a range of community standards and databases and the  
26 FAIRSharing<sup>[1]</sup> community standards site (<https://fairsharing.org>) for best practices and semantic pre-  
27 cision. The journal endorses the FAIR<sup>[2]</sup> data principles (<https://www.go-fair.org/fair-principles/>)  
28 and we recommend database submission of datasets and workflows to replace most of the prior use cases for  
29 Supplementary Information.  
30

31 Research Articles should offer a new and substantial conceptual advance based on original experimental  
32 research and data, whereas Technical Reports need only detail a useful new method. Perspectives are liter-  
33 ature reviews that set standards or propose future strategies in our field. Analysis articles offer opportunity  
34 to generate and test new hypotheses by interoperating or reusing existing datasets with new workflows. Re-

35 sources provide provenance and curation of new datasets that will be of use to the community. If submissions  
36 are outside the scope of the journal or if editors consider them premature with respect to their field, we will  
37 make customized recommendation for appropriate Wiley journals that would peer review the work or suggest  
38 revisions that would typically qualify the work for peer review.

39 Enabling the market for genomics-based ideas needs generosity with rich metadata and careful attention to  
40 semantic precision, as well as a sensitive understanding of the legal, ethical and economic underpinning of  
41 resources based in the code and the families of living people. For an editor, this means having patience  
42 in the face of the many exceptions to the ideal of publicly funded, universal research access to all human,  
43 animal and plant genomes and their associated traits and measurements. The resource-benefit balance is  
44 ever-present, and legal and ethics frameworks of genetic research evolve slowly in the legacy of past abuses  
45 of concepts of heredity. It is therefore essential that we recognize those data license conditions that aim  
46 to preserve participation of research subjects, build local resources and capacity and return benefits to the  
47 societies that initiated the studies. So, when genetics advances only on the terms of a commercial animal  
48 breeder or a security-conscious government, the conclusions and resources offered in the publication need to  
49 be maximized for reuse without derailing the sustainable long-term commitment of those producers to make  
50 their results available. Even in the sphere of publicly funded data resources in developed countries, it may  
51 be networks of excellence (consortia) spanning continents, institutions and generations of diverse funding  
52 sources that are the guarantors of the security of the research subjects' data and the translational success of  
53 the research. Publishers looking for a highly cited paper - or data reusers looking to test their new algorithm  
54 - need to see where they fit in, and lobby for greater FAIRness from well-funded data generators. Proof of  
55 the reuse and interoperability of open research rests with the data users, so data providers need to enable  
56 and encourage their work.
