

Figure 1. Experimental design flow chart

Figure 2. protein protein interaction Schematic diagram

Figure 3. Compound-target network generated by top 10 TCM candidates (ranked by Dock Score) of each protein from database screening.

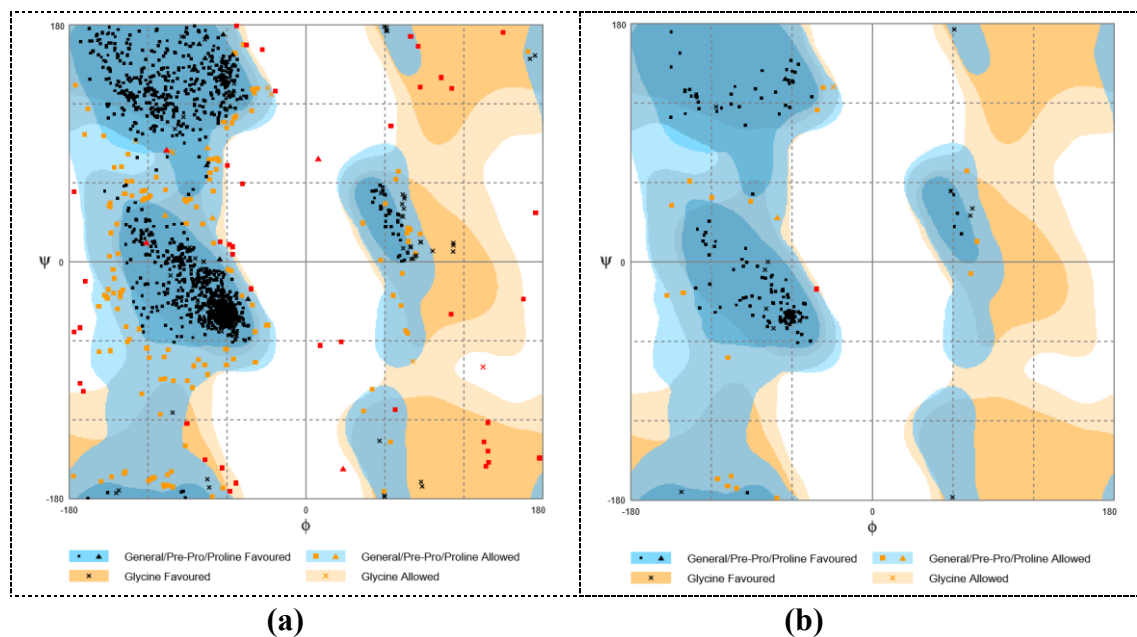

Figure 4. (a) Ramachandran plot validation of our modeling structure. It can help us to find whether the structure is reliable (b) All the plots mean the amino acids of binding sites, in order to find if these amino acids which is important to our study stood in best or allowed fold region.

Figure 5. The 3D-profilevalidation of modeling structure. The Verify Score which is higher than 0 signifies the trusted simulation of amino acids.

Figure 6. The known small molecular structure of NLRP3 inhibitors from previous study

Figure 12. Scatter plot presenting the results of experiments.

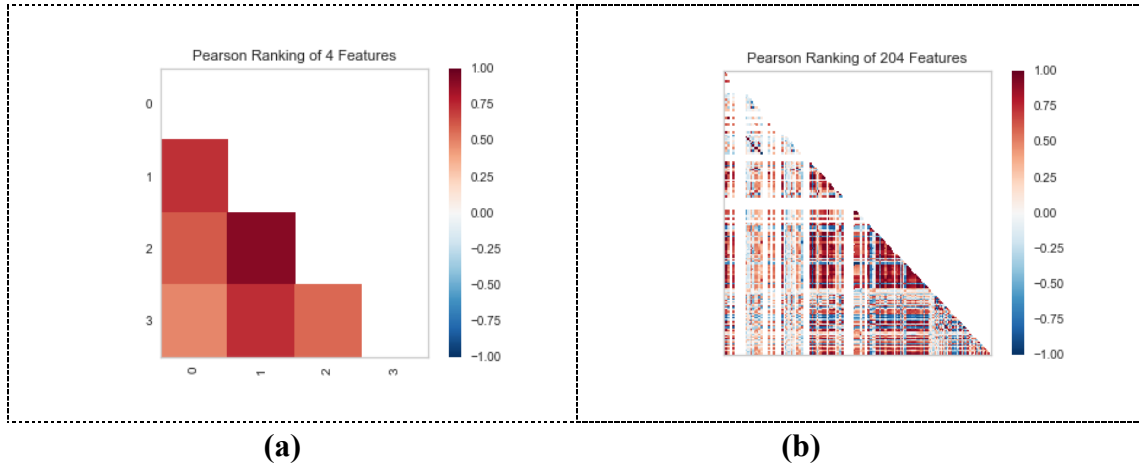

Figure 13. (a) Pearson correlation coefficient matrix heat map of three selected features.(b) Relation of 204 features ranked by Pearson correlation coefficient.

Figure 14. 2D PCA visualizations obtained using Yellowbrick.

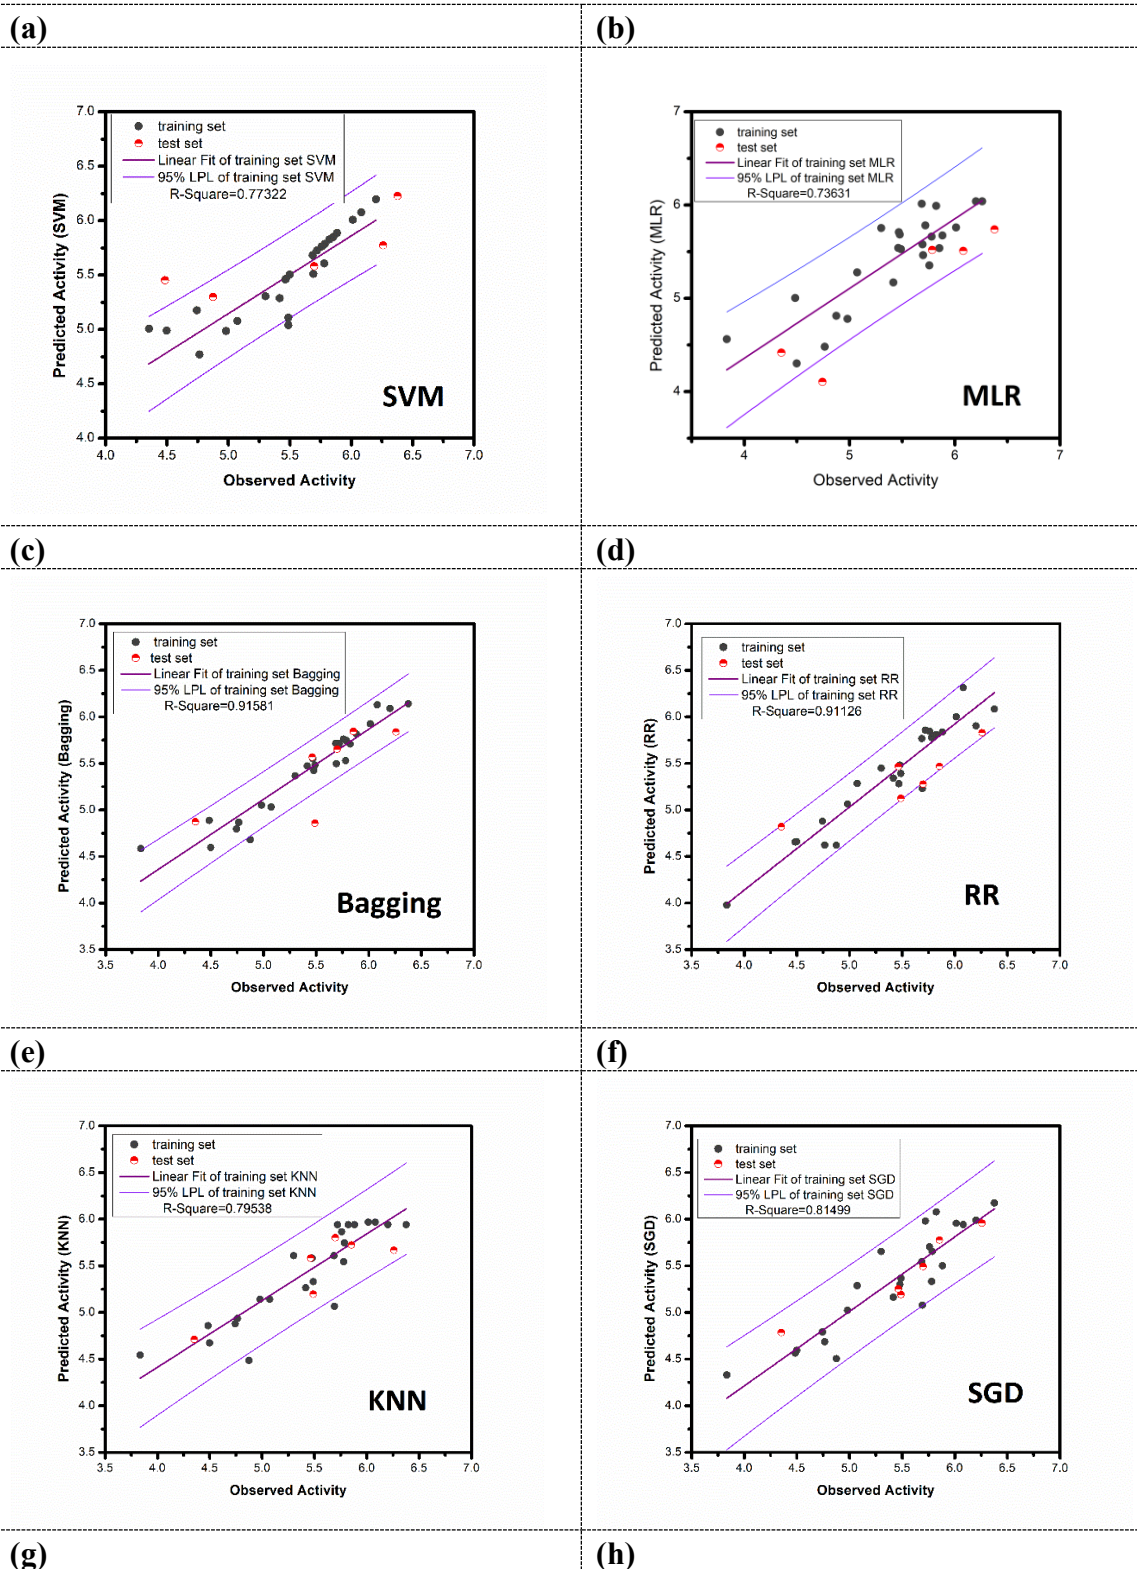

Figure 15. 3D PCA visualizations obtained using Yellowbrick.

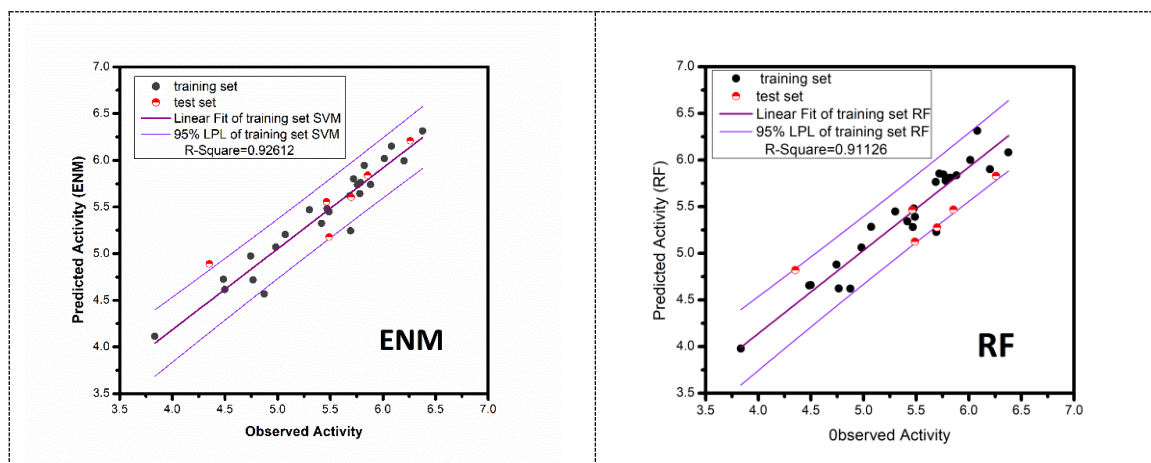

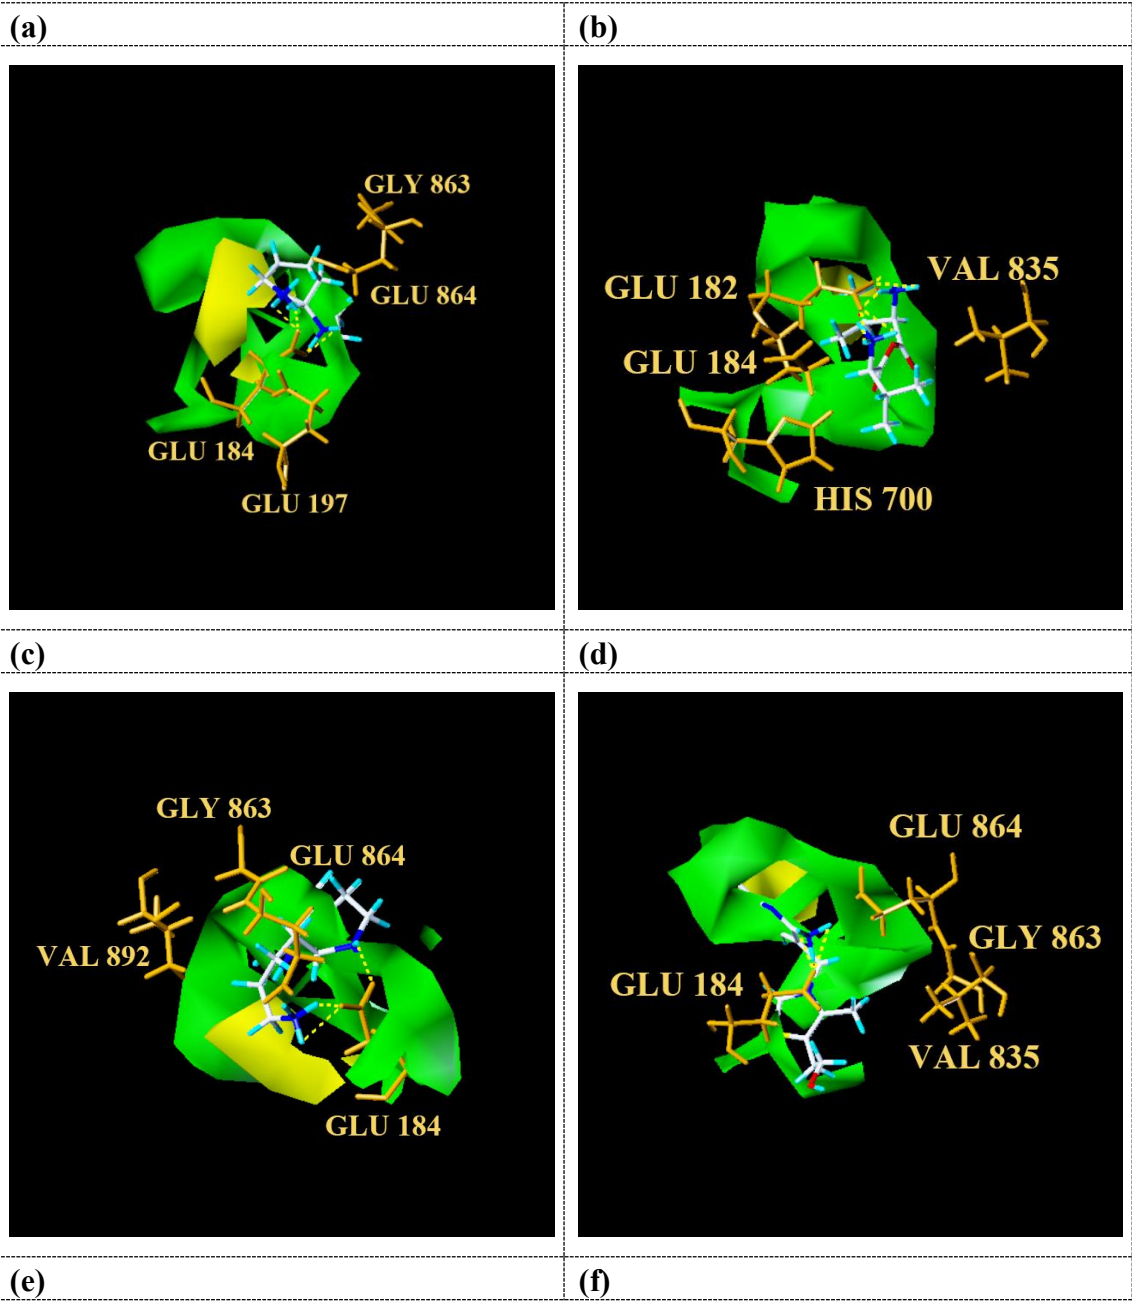

Figure 16. AI models for NLRP3 respectively. The SVM and MLR models identify relationships between observed and predicted activity (pIC_{50}). Correlation trend (purple lines) and 95% prediction confidence regions (enclosed by red lines) were presented. Training set (black dots) and testing set (red dots) were shown. Correlation coefficients (R^2) of the QSAR models were all higher than 0.70.

Figure 17. Structural contouring of TCM candidates and NLRP3 control to CoMFA mapping. (a)2007_22057, (b) 2007_22325, (c) 2007_15317, (d) 8909, (e)7959, (f) 17. The yellow dotted line indicates a hydrogen bond

Figure 18. Structural contouring of TCM candidates and NLRP3 control to CoMSIA mapping. (a)2007_22057, (b) 2007_22325, (c) 2007_15317, (d) 8909, (e)7959, (f) 17. The yellow dotted line indicates a hydrogen bond.

Figure 19. Total energy changes during molecular dynamics simulations between NLRP3 protein with three candidates. Different colors represent different molecular candidates, which could demonstratively reveal the state of complex.

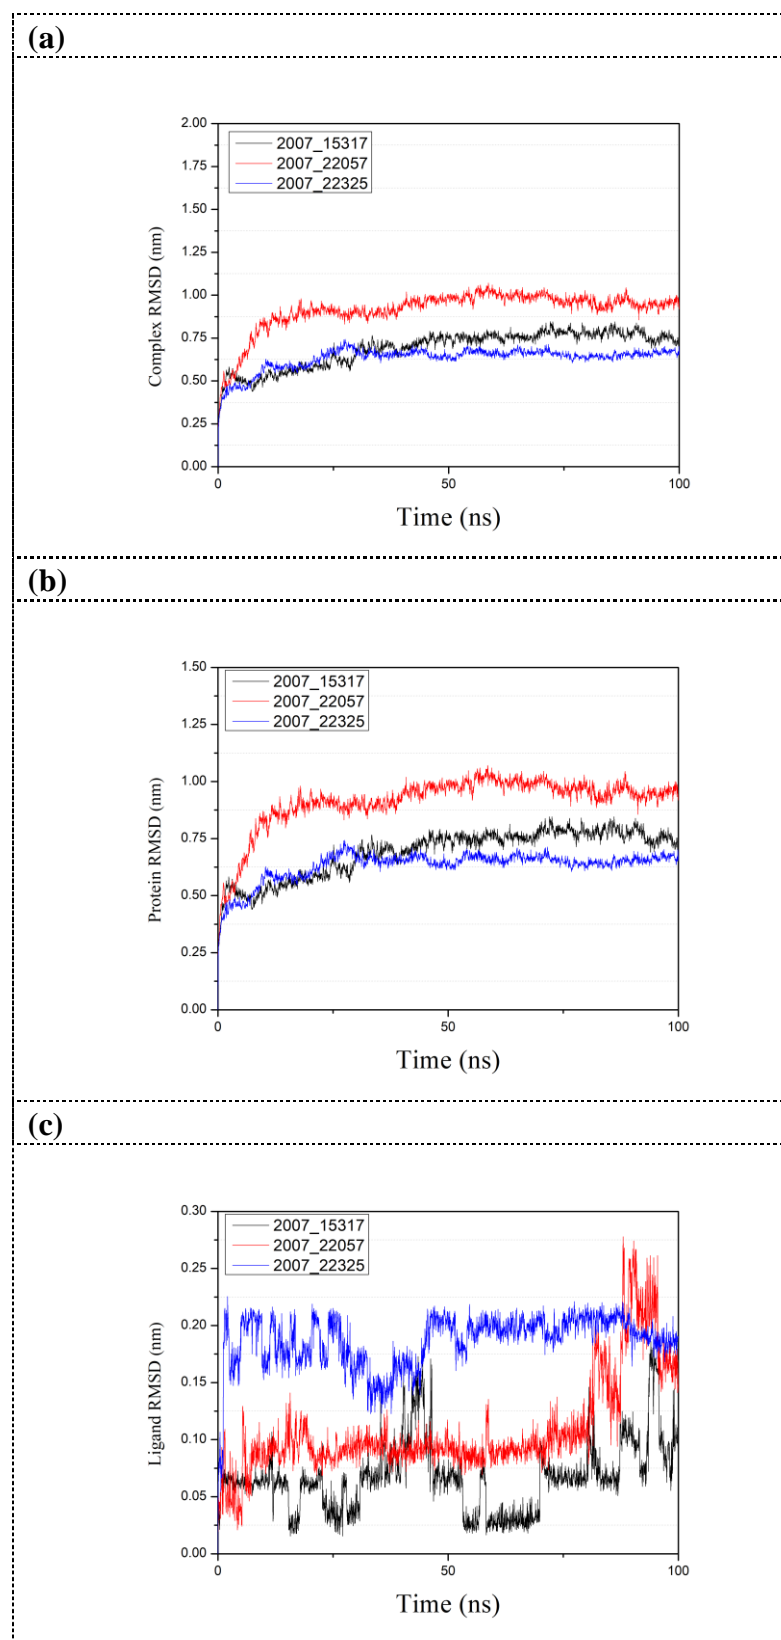

Figure 20. RMSD changes during molecular dynamics simulations between NLRP3 protein with three candidates. Different colors represent different molecular candidates, which could demonstratively reveal the state of complex. (a) RMSD changes of complex (b) RMSD changes of protein (c) RMSD changes of ligand

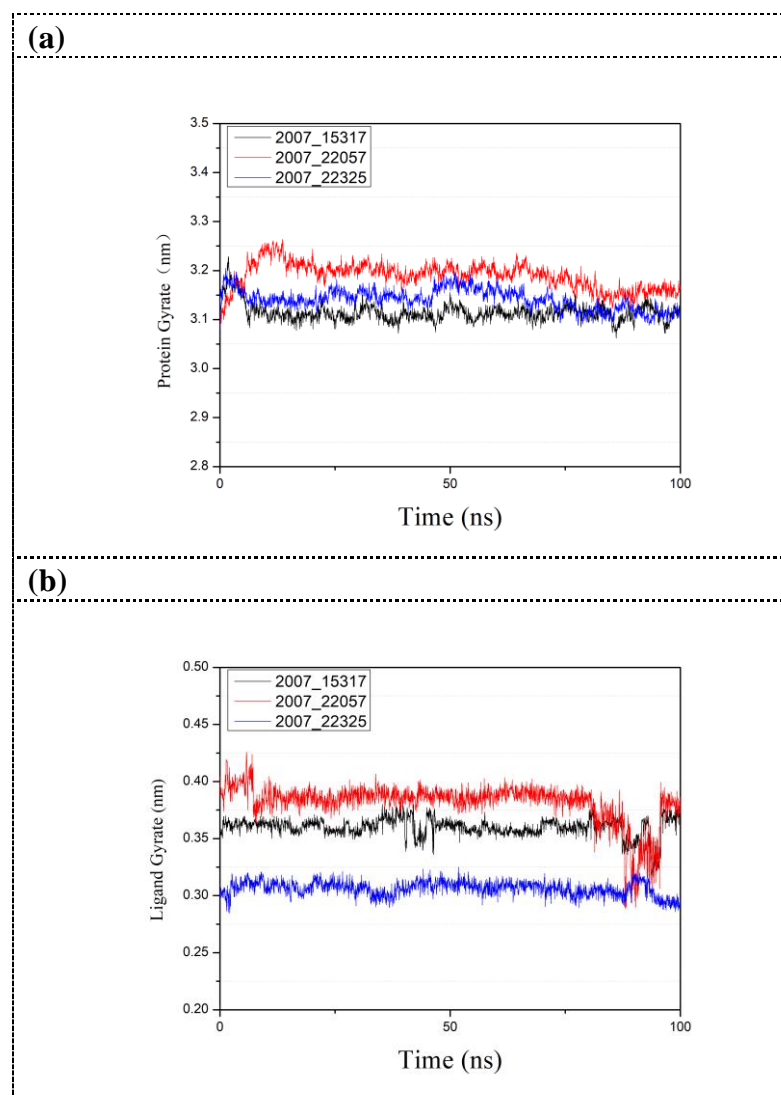

Figure 21. Gyrate result of target complex with three candidates. Different colors represent different molecular candidates, which could demonstratively reveal the state of complex. (a) Gyrate result of protein (b) Gyrate result of ligand

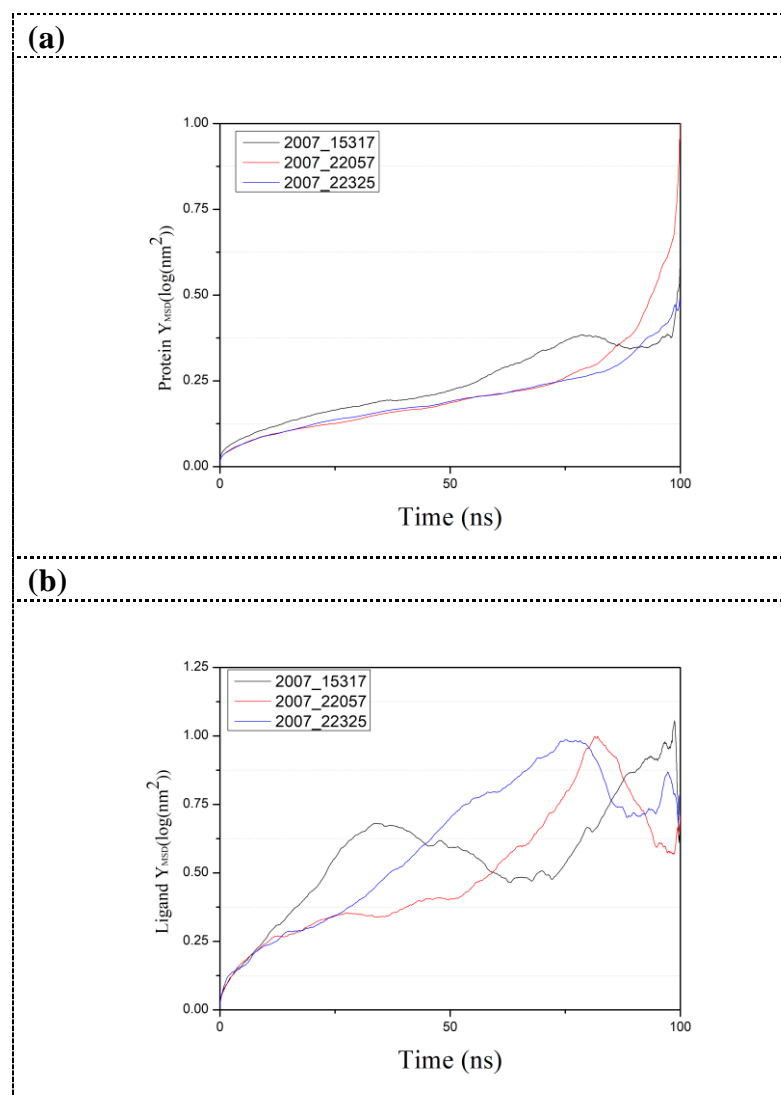

Figure 22. MSD result of target complex with three candidates. Different colors represent different molecular candidates, which could demonstratively reveal the state of complex. (a) MSD result of protein (b) MSD result of ligand

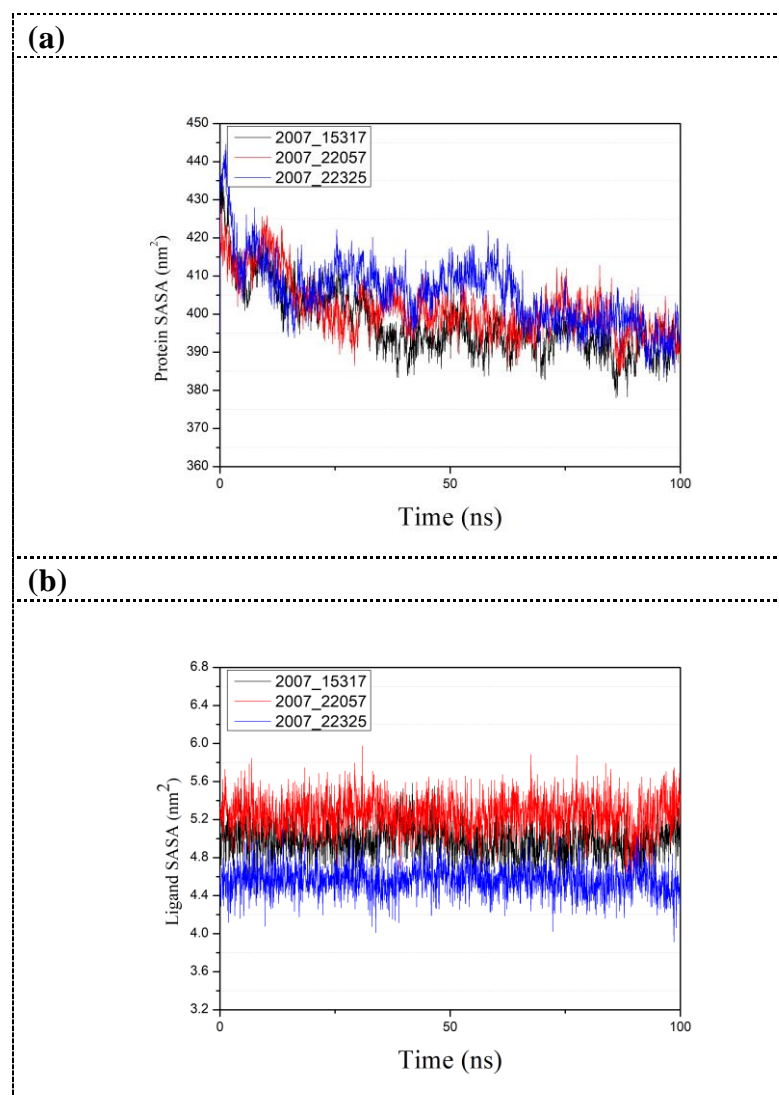

Figure 23. SASA result of target complex with three candidates. Different colors represent different molecular candidates, which could demonstratively reveal the state of complex. (a) SASA result of protein (b) SASA result of ligand

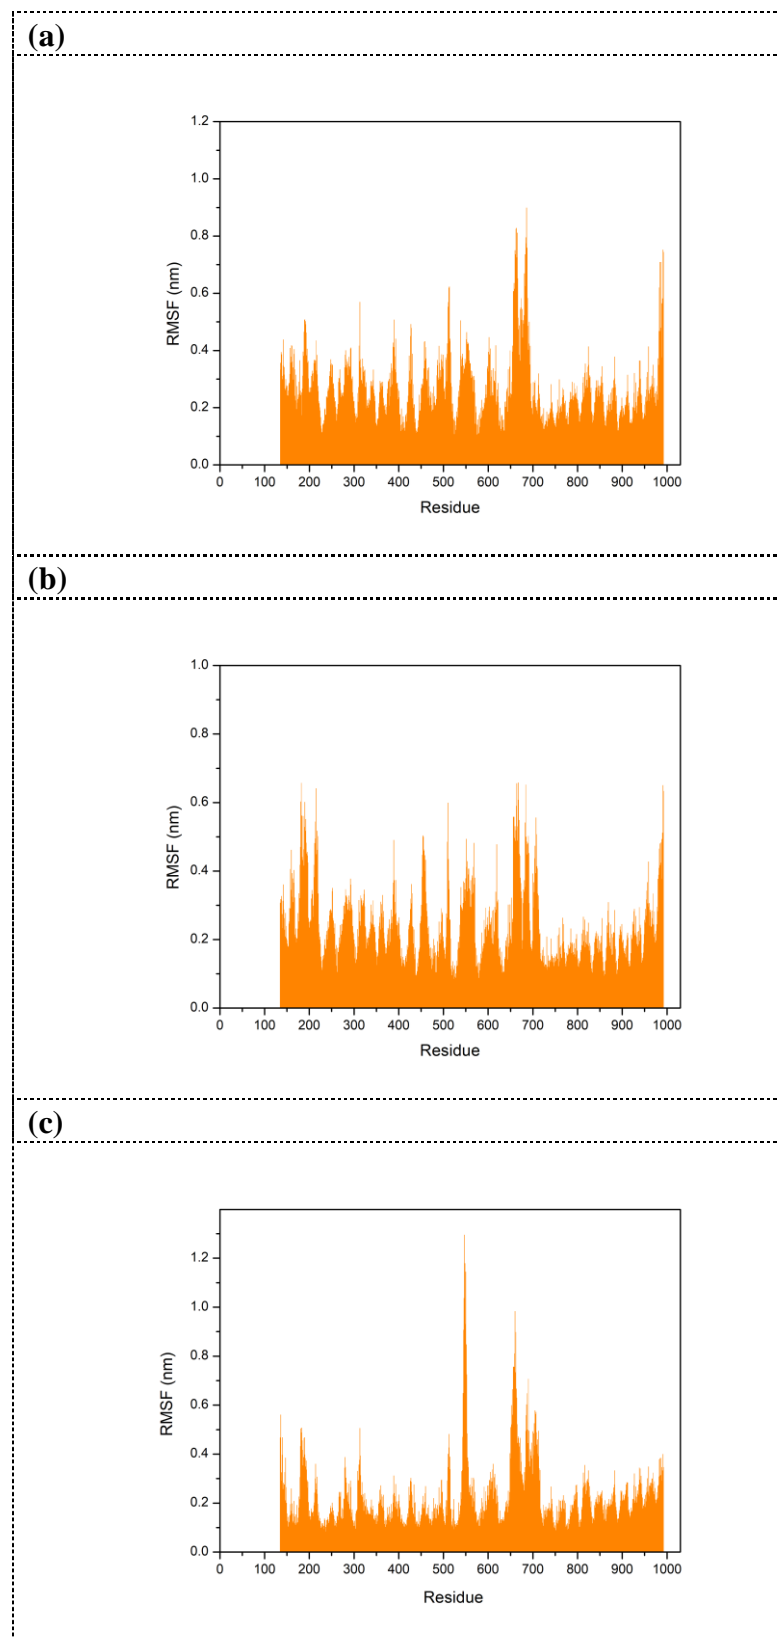

Figure 24. RMSF value of each residue on various protein. The figure can intuitively show the amplitude of each residual and show which residual has a larger range of variation. The abscissa was the number of protein residue sequences. Whether different ligands have similar effects to the target protein can also be judged by the figure. (a) 2007_15317 (b) 2007_22057 (c) 2007_22325.

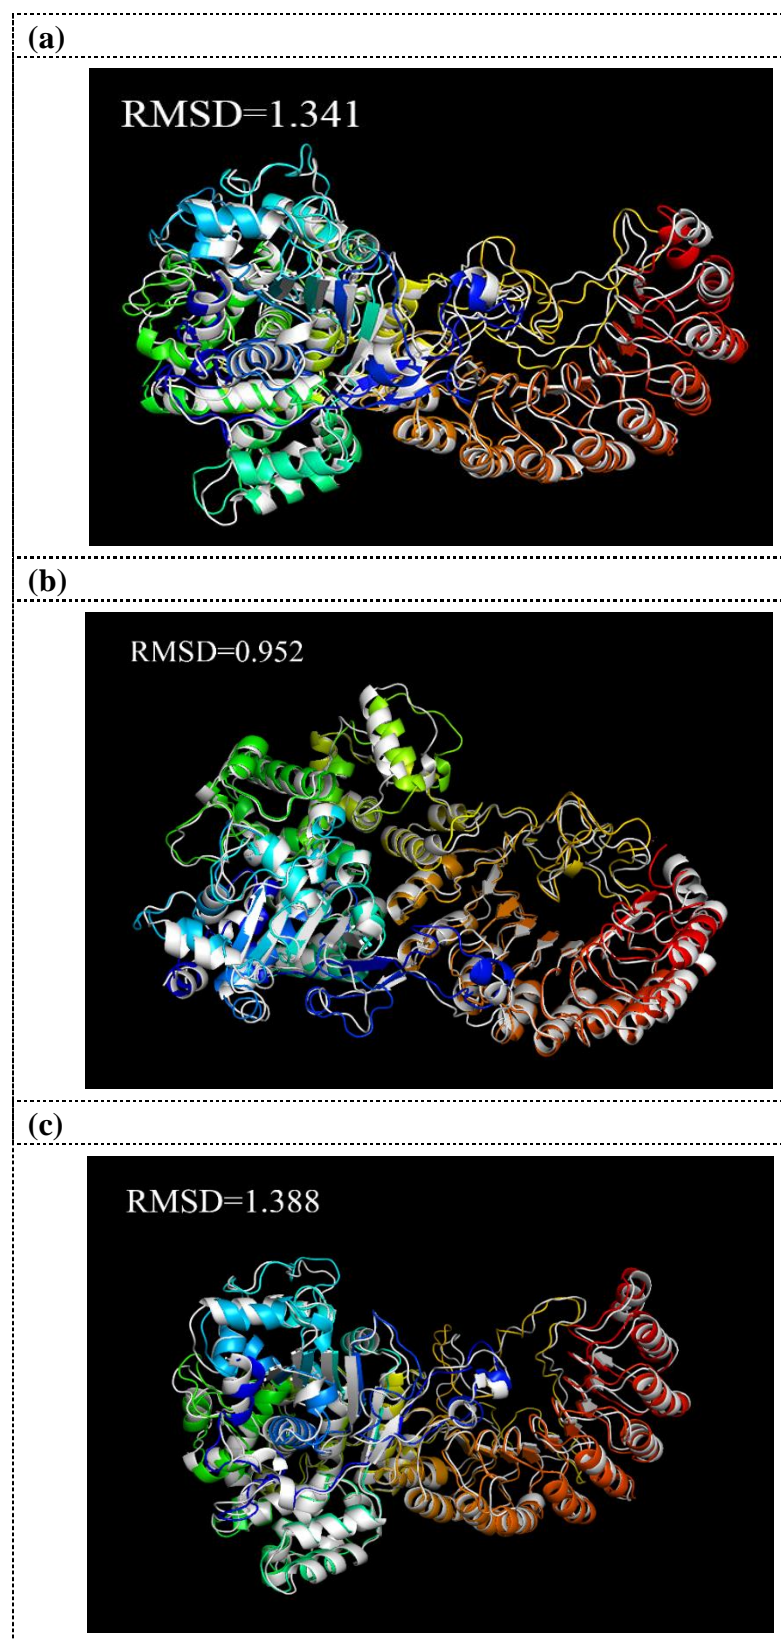

Figure 25. Average structure of each proteins reacted with different ligands. The average structure and the final state structure are superimposed to obtain RMSD values, and these structures were to observe whether their conformational changes were consistent, which indicate that the final state structure has good stability. (a) 2007_15317 (b) 2007_22057 (c) 2007_22325. (The ligand was not shown in figure)

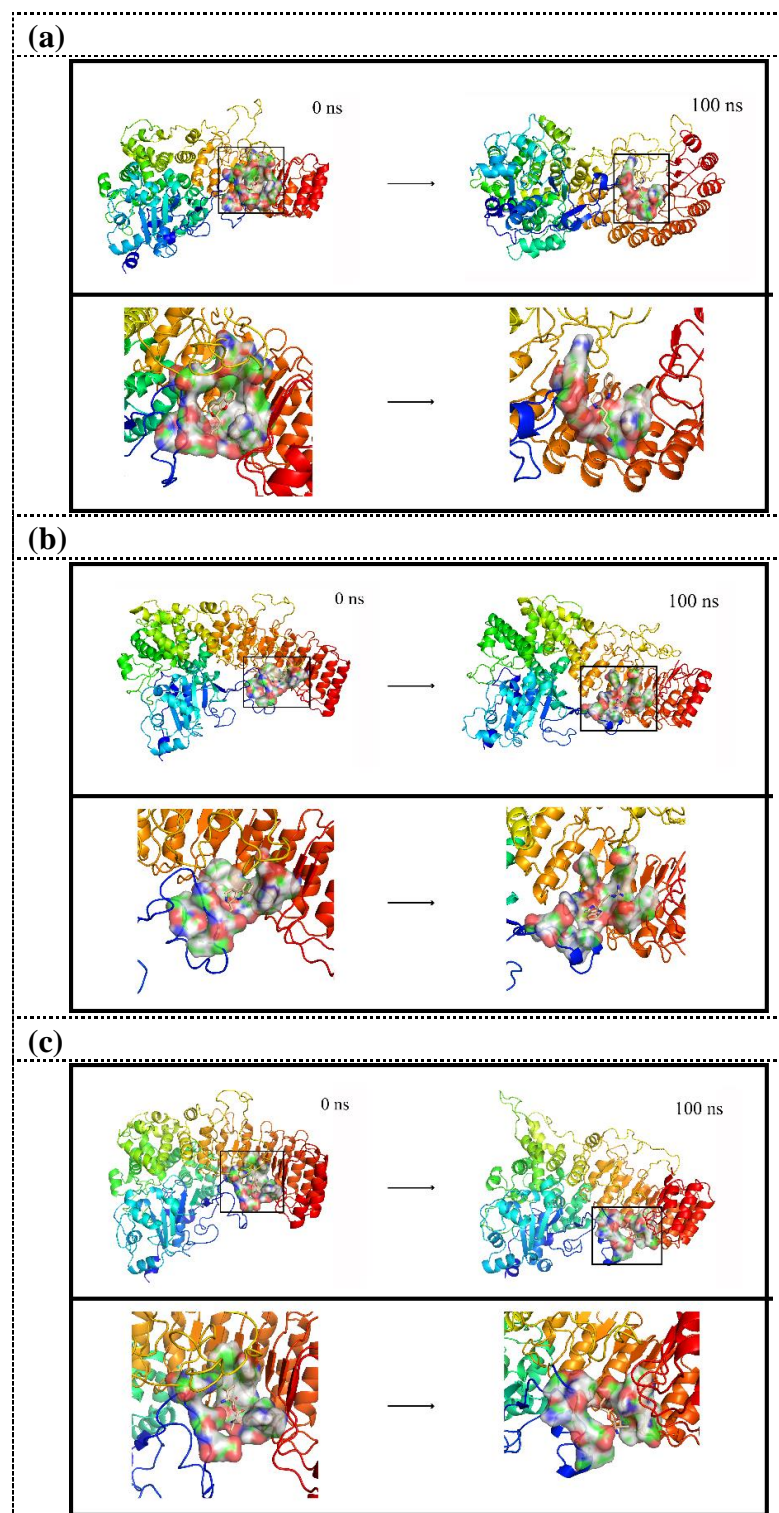

Figure 26. Combining posture changes during MD in microenvironment. Although the state of the ligand changes, the position where the ligand binds to the target protein does not change. (a) 2007_15317 (b) 2007_22057 (c) 2007_22325
