

To the Editor

I hope this re-submission meets the required format, I am awaiting approval for a FAIR dataset. A website is also in construction, so till then I attach the data uploaded files for the reviewers.

I realize the topic of this manuscript can be controversial in some fields of climate science, but to be clear, the work uses never before seen physical evidence that further **disproves** arguments, that current global warming is “due to the Sun”, albeit it does it in a new way with the Moon as a constant (i.e. like a bucket of ICE for calibrating a slow leaking thermometer over time, just as the orbital telescopes are also degrading).

I would very much appreciate your opinions on it.

Kind regards

Grant
