Figure S1.   The percent change in price of food crops normalized by percent protected land plotted against regional GDP in 2100. Regions are depicted by colors and SSPs are depicted by shapes.

December 7, 2021, 2:08pm
Figure S2. Change in total carbon emissions (from land use change and fossil fuel and industrial sources) through time in metric tonnes of Carbon. The top left panel shows global carbon emissions at the baseline (i.e., with no constraint imposed). Colors indicate the SSP scenario. The solid lines depict the median within the SSP group while the transparent ribbons show the range over all scenarios within the SSP group.
